USING THIS CATALOG

1. This catalog is as of June 2023.

2. Please note that products in this catalog are continuously reviewed and updated. The products therefore may be changed in the future and thus become different from the catalog.

3. Stock status is mentioned for the products in this catalog. However, please note that the products here may be replaced by new grades and products in the future.

   Note 1) Please contact us for dimensions not mentioned in this catalog.
   Note 2) Please contact us regarding order numbers and grades that are not mentioned in this catalog.

4. Stock status indication

● : USA Stock **★ : Stocked in Japan** **□ : Made to Order** **▲ : Inventory maintained To be replaced by new products**

HOW TO USE THIS CATALOG

In this catalog, our company's cutting tools are broadly divided into two types: turning tools and rotating tools, with separate respective sections for each machining method. Please select the search method that matches your requirements when using the catalog.

1. **Search for tool types from the CONTENTS.**

2. **To find the series of products from the index of the inside title**.
   Index of each block are listed on each inside title.

3. **To find the product according to application.**
   The classification page of each block provides the series of products to be selected according to applications and purposes.

4. **Search using the alphabetical index.**
   All tools are listed in the alphabetical index at the front of the catalog.

5. **How to use the block sections.**
   A usage guide for each block is shown on the left of each index (not for all blocks). Refer to this page to know how to read the product information and how the page is organized.

OTHER WAYS TO USE THE CATALOG

The following PR materials are also available in addition to this catalog, for use as necessary.

1. **Catalogs for individual products**
   • Access the following URL and download "Tool News" for the applicable cutting tool.
   Information about tool features and examples of cutting applications are available in greater detail.

http://www.mmus-carbide.com/download/tools_news

2. **Online catalog (electronic catalog with search functions)**
   • Access the following URL to search for applicable cutting tools and view detailed information.
   CAD data, tooling sheets, and other resources are also available for download.

http://www.mitsubishicarbide.net/mmus/enus/

STATEMENT

YOUR GLOBAL CRAFTSMAN STUDIO

Mitsubishi Materials is not just a tool manufacturer

We are committed to responding promptly to customers' challenges and to actively contribute to their success with the dedication of a professional craftsman.

We will strive to become the only tool manufacturer globally offering "your personal craftsman studio", a unique service for our customers.

It is the place where you can:
Find state-of-the-art technologies and products.
Find solutions, anytime, from anywhere in the world.
Share our excitement about the latest technology trends and product innovation.

It is the studio where we think, share, create and develop together with our customers, exciting solutions to meet their specific needs.

YOUR GLOBAL CRAFTSMAN STUDIO
MITSUBISHI MATERIALS

The meaning of our logo
Our logo shows people, standing on a circle, holding hands. The circle represents the earth. Holding hands reflect our commitment to grow and succeed "hand in hand" with our customers and closely work with them to improve performance across the globe. The shape of the logo embodies a variety of ideas. It captures the image of "cutting tools" combined with the dominant letter "M" of the Mitsubishi Materials brand name. It also depicts a flame that symbolises our passion for craftsmanship.

Now available!

A magazine for communication to
encourage excitement about manufacturing

YOUR GLOBAL CRAFTSMAN STUDIO

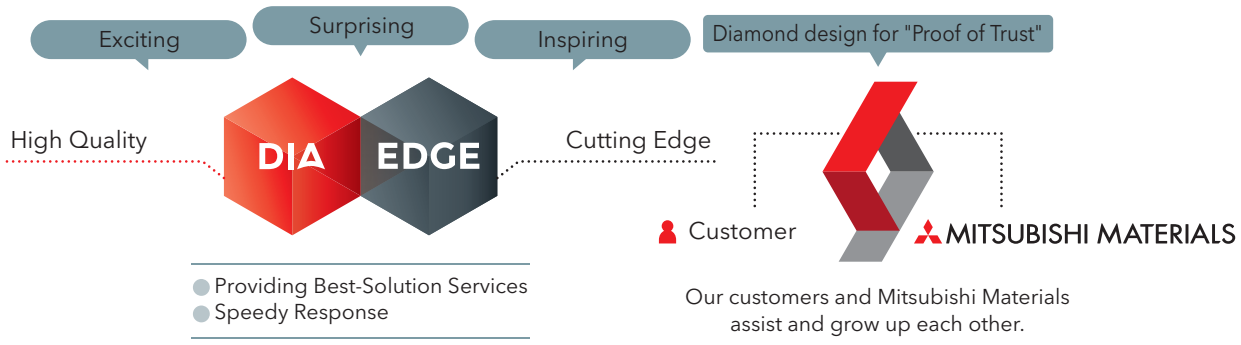
PRODUCT BRAND

With "DIAEDGE," Mitsubishi Materials Metalworking Solutions Company will aim to become the leading company in carbide product business while sharing ideas, creations and feelings with customers through the provision of optimised carbide product solutions and services.

DIAEDGE

Together with our customers, creating a better future

Announcing DIAEDGE, our new brand of tools
that brings together our cutting-edge technologies, exciting all who use them.
Our aim is not only to offer value with our tools,
but to think together with our customers, share inspiration with them,
and continue to take on new challenges.



Tool Solutions

INSERT GRADES

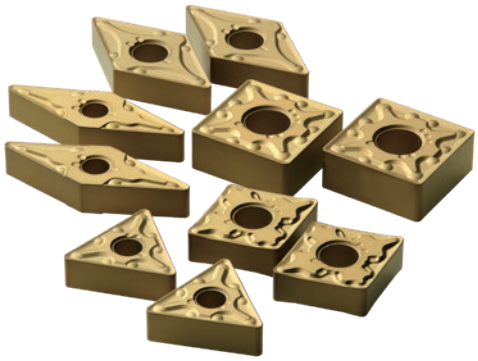
MC6100 Series

» A015
» A020
» A038
» A039

CVD Coated Grade for Steel Turning **P**

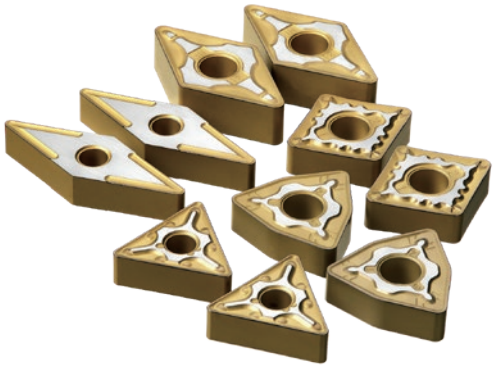
MC6115

Improves high-speed machining and process efficiency with a dramatic increase in resistance to heat and wear



MC6125

First Recommendation for Steel Turning Increases tool life with a stable performance over a wider range of applications



MC5100 Series

» A017
» A023
» A038
» A039

CVD Coated Grades for Cast Iron Turning **K**

MC5105

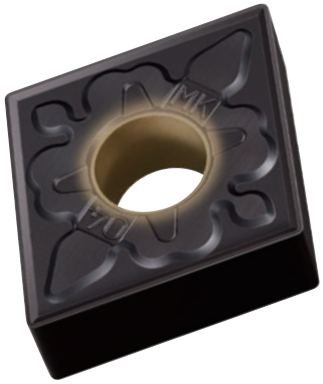
Provides outstanding wear resistance when turning gray cast iron at up to 3280 SFM (1000 m/min) cutting speeds.

MC5115

Prevents abnormal cutting edge damage and displays excellent wear and fracture resistance when machining ductile cast iron.

MC5125

Demonstrates excellent fracture resistance that can withstand heavy interrupted cutting of high strength ductile cast iron.



MS6015/MS7025/MS9025 Series

» D002

PVD Coated Carbide Grade for High Precision and Small Parts Machining

P M S

Greater Enhancement of Turning Inserts for Machining of Small Parts
By selecting the optimum grade for each workpiece material, a stable surface finish and dimensional accuracy are achieved

MS6015

Achieves stable finished surfaces and excellent dimensional accuracy when turning pure iron, carbon steel and free cutting steel

MS7025

Dramatically improved welding and wear resistance in low feed machining with a more precise nano-multilayer coating

MS9025

Effective reduction of notch wear of stainless steel with a balance of wear and fracture resistance

BC8200/MB8100 Series

» B006
» B010

CBN-Series for Hardened Steel Turning

H

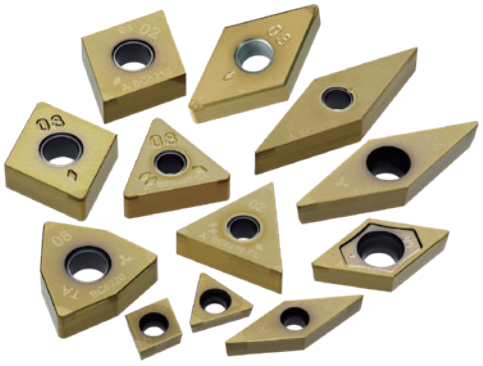
COATED CBN MATERIALS

BC8210 Continuous and Light Interrupted Cutting

Outstanding Tool Life with High-Speed Machining

BC8220 General cutting

Achieves Impressive Tool Life Over a Wide Range of Cutting Conditions



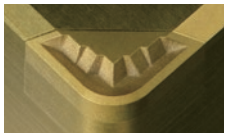
BC8200 Series

CBN Grade (Uncoated)

MB8110 Finish Cutting

MB8120 High Efficiency Machining

MB8130 General cutting



BR Breaker
(BC8220)

BM Breaker

BF Breaker

Tool Solutions

CUTTING OFF AND GROOVING SYSTEM

GY/GW Series

» D004
» F004
» F016
» F218

Holder for High Precision Machining of Small Parts

The new geometry with an extremely high rigidity suppresses vibrations and dimensional changes thereby solving problems during cutting off!

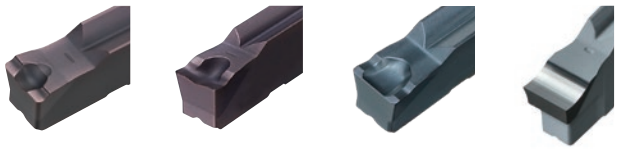
GY series Square type holder

For Cutting Off and Grooving
Maximum Grooving Depth :
1.339 inch (34 mm)

Shank Diameter ; □3/8"□10 mm
Cutting Width : .059 inch (1.5 mm)

A breaker system made for a wide variety of inserts that can be used for machining a huge range of applications

● For Cutting Off and Grooving

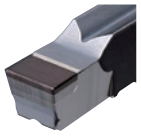


GU Breaker (Gummy Steel)
GS Breaker (Low feeds)
GM Breaker (Medium feeds)
GL Breaker (Aluminum Alloys)

● Cutting Off

R/L05-GM Breaker (Medium feeds)

● Grooving



GFGS Breaker (Hardened Steel)

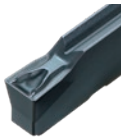
● Copying/ Recessing

BM Breaker (Copying/Recessing)

● For Multifunctional Grooving

MF Breaker (Finish Machining)

MS Breaker (Low feeds)



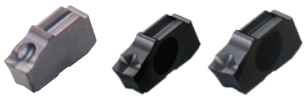
MM Breaker (Medium feeds)

GW series Square type holder

Cutting Off
Maximum Grooving Depth :
2.992 inch (76 mm)

Shank Diameter ; □5/8"□16 mm
Cutting Width : .079 inch (2.0 mm)

A Breaker System Offering Excellent Chip Disposal Properties



GS Breaker (Low feeds)

GM Breaker (Medium feeds)

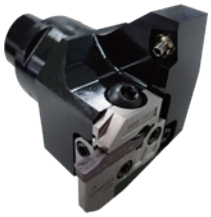
GY Series

» F188
» F010

PSC Holder for Cutting Off and Grooving

The double taper and face contact uses precision machined polygon geometry to provide high clamping rigidity.

00° type holder



90° type holder

Easy exchange between different sizes and types of applications by simply changing the blade.
A breaker system made for a wide variety of inserts that can be used for machining a huge range of applications.

Tool Solutions

MILLING CUTTER

WJX Series

» K308
» K318

Double-Sided Insert Type
High Feed Radius Milling Cutter

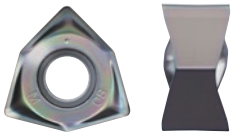
With a low resistance L Breaker and a reinforced cutting edge R Breaker added, the new WJX09 Small Insert Type enables higher feed rates by increasing the number of blades!

WWX Series

» K112
» K120

Double-Sided Insert Type
Shoulder Milling Cutter

The optimized "X-type" insert realizes stable and high-quality machining. This new evolution of the shoulder mill allows for greater stability and high-quality machining!



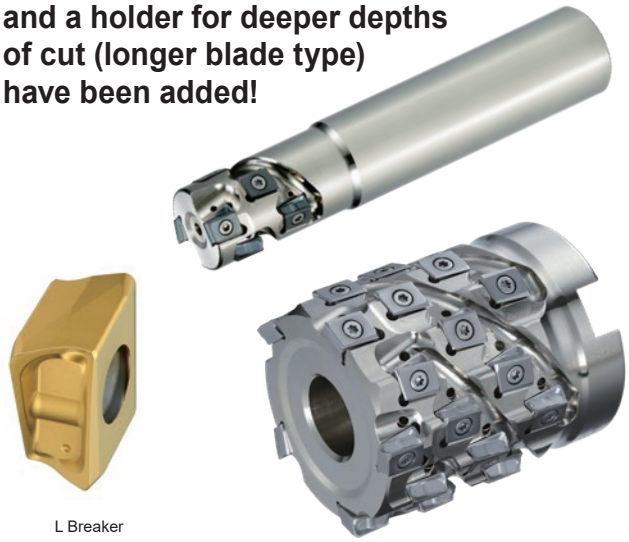
Strong X Geometry

VPX Series

» K182
» K193

Multi-Functional Cutter
for High Efficiency Machining

In order to expand the applications of the VPX300, a low resistance type L breaker and a holder for deeper depths of cut (longer blade type) have been added!



L Breaker

ASPX Series

» K262

For Machining Titanium Alloys

Vibration Control Features + Low Cutting Resistance Equals Extremely Stable, High-Efficiency Cutting!

SOLID END MILLS / EXCHANGEABLE HEAD END MILLS

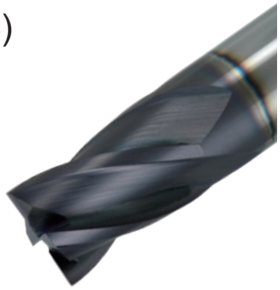
MSplus Series

» I097
» I100
» I103
» D005

End Mill for Swiss Type Automatic Lathes

Enhanced Burr Reduction and Fracture Resistance to Solve Typical Swiss Lathe Machining Problems!

MP2ES (2 Flute)
MP3ES (3 Flute)
MP4EC (4 Flute)



IMPACT MIRACLE REVOLUTION

» I272
» I268

For Machining of Hardened Steels

IMPACT MIRACLE

Revolutionary Machining of Hardened Steel
New coating provides outstanding tool life
Lineup expansion with the addition of a new series!

4 Flute, Precision Corner-Radius End Mill

VFRPSRB

2 Flute, Ball Nose, Long Neck End Mill

VFR2XLB

iMX End Mill Series

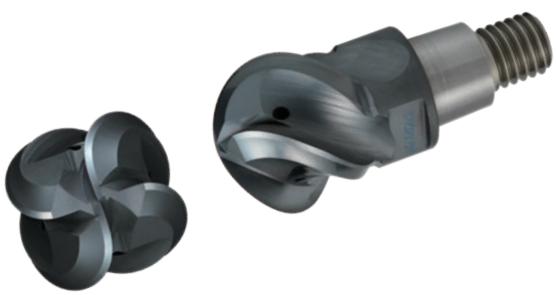
» J070
» J056

Exchangeable Head End Mills

"Carbide"+"Carbide" Double Face Contact Type
(Head) (Holder)

The 4 flute, lollipop head with coolant hole, B4WH-S, and the 4 flute, roughing head with coolant hole, RC4F-C, for machining of titanium alloys have been added to the series!

iMX-B4WH-S



iMX-RC4F-C

SMART MIRACLE Series

» I172 » I164
» I112 » I182
» I114 » I005

Vibration Control End Mills for Machining Difficult-to-Cut Materials

Addition of Lollipop and Radius End Mills to the Series!

Multi-Functional Lollipop End Mill
VQ4WB

Duplex Radius End Mill
VQFDRB

Vibration Control, Corner Radius End Mills
VQHVRB

Long Neck Ball Nose End Mill
VQ2XLB

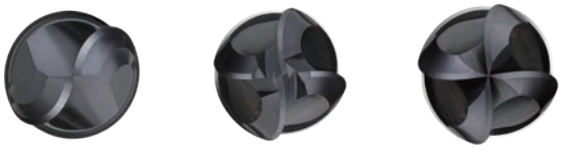
Corner Radius End Mill
for High Efficiency Titanium Alloys Machining
VQT5MVRB (with coolant hole)

SMART MIRACLE Series

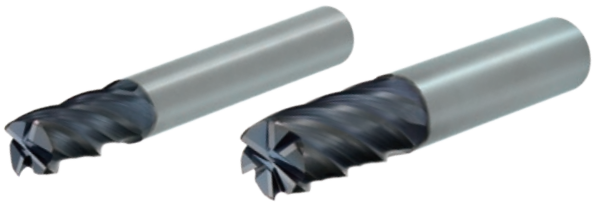
» I187
» I189
» I190
» I192

End Mill for Machining Heat Resistant Super Alloys

2 & 4 Flute, Ball Nose, Medium Cut Length End Mill
VQN2MB/4MB/4MBF



4 & 6 Flute, Corner Radius, Medium Cut Length End Mill (M)
VQN4/6MVRB



Alimaster Series

» I279
» I280
» I277
» I278

High Efficiency Machining of Aluminum Alloys

Highly efficient machining is possible with optimized cutting edge geometry and helical internal coolant holes!

DLC Coating
DLC3SA, DLC3SARB

Uncoated
A3SA, A3SARB

Tool Solutions
DRILLING

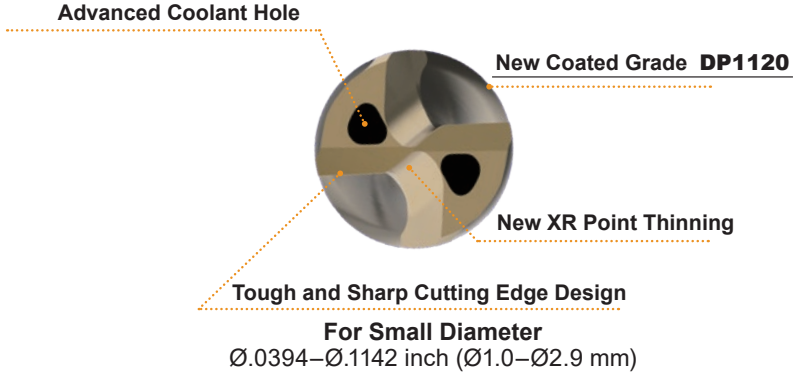
DVAS Series TRISTAR Drill Series

» L008
» D005

Solid Carbide Drills

FAST, RELIABLE and ACCURATE
New standards enabled by the Five Technologies!
~Faster cycle times and higher accuracy~

- Large coolant holes reduce tool damage due to the improved cooling effect thereby greatly improving tool life
- New cutting edge geometry that significantly improves fracture resistance and a new coated grade with excellent wear resistance
- New XR point thinning for high efficiency machining



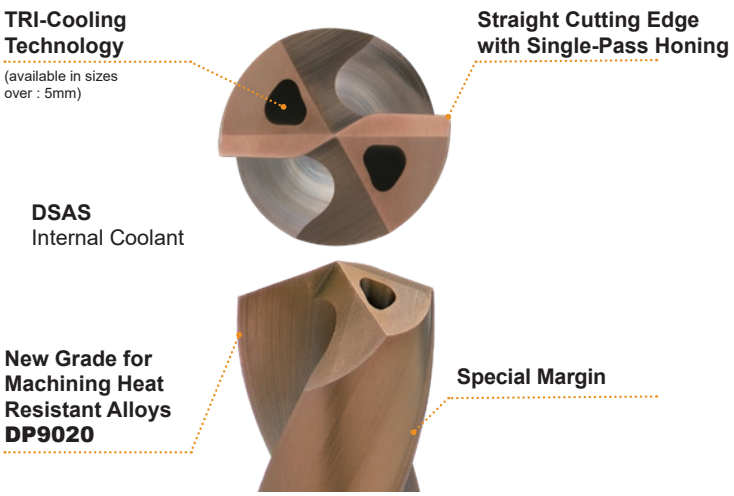
For Small Diameter
Ø.0394–Ø.1142 inch (Ø1.0–Ø2.9 mm)

DSA Series

» L168

Solid Carbide Drill for Machining Heat Resistant Super Alloys

For Long Tool Life when Machining Heat Resistant Super Alloys!
The specially designed margins for machining heat resistant alloys minimize the contact area and prevent work hardening

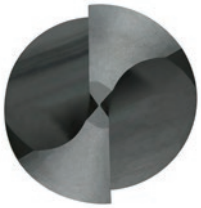


DLE Series

» L192

Solid Drills for Centering and Chamfering

A mini size of ϕ.0394–ϕ.0984 inch (ϕ1.0–ϕ2.5mm) has been added to Solid Carbide DLE Series of drills.



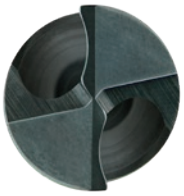
DC : Ø.0394–Ø.6299 inch
(Ø1.0–Ø16.0mm)
SIG : 60°, 90°, 120°, 145°

DWA E Series

» L175
» D005

Carbide Solid Drill Series
for Swiss Type and Small CNC Lathe Machines

Adopts an optimal flute length with a low cutting resistance ideal for Swiss-type automatic and small CNC lathes!



Improved tool rigidity

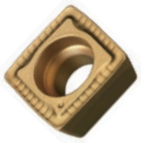
DC : Ø.0394–Ø.5512 inch
(Ø1.0–Ø14.0mm)
L/D : 2, 4

MVX Series

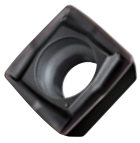
» L199

Indexable Drills

High rigidity body produced by utilizing the latest technology.



UM Breaker



US Breaker

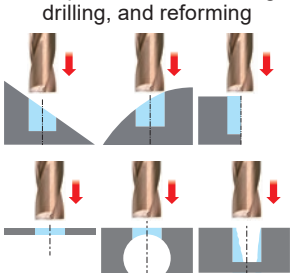
MFE Series

» L183

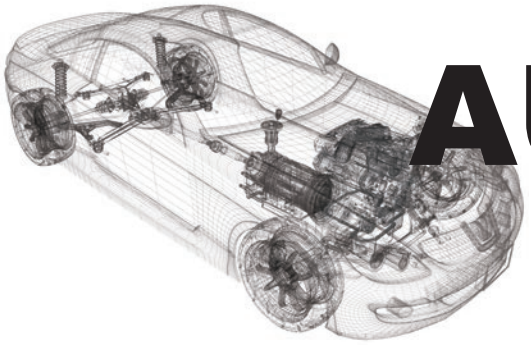
Solid Carbide Flat Bottom Drills

Process shortening with high efficiency drilling in various types of machining
Highly Popular Versatile All-Purpose Drill!

Examples of counter boring, drilling, and reforming



DC : Ø.0295– Ø.7874 inch
(Ø 0.75–Ø20.0mm)
L/D : 2



AUTOMOTIVE

We offer high performance cutting tools that use the latest technology to meet the needs of the automotive industry.

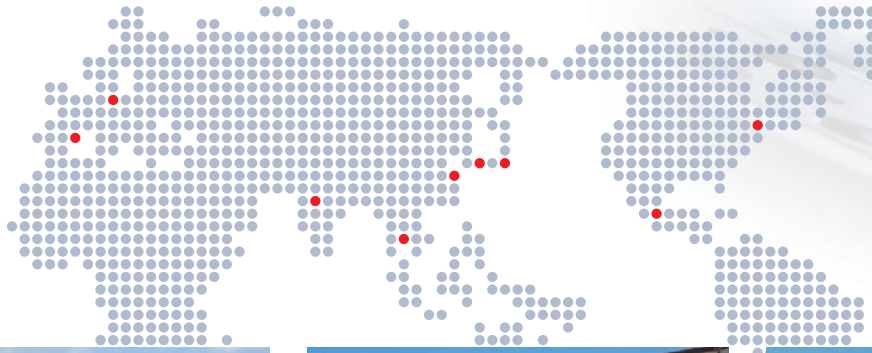
Customer Service

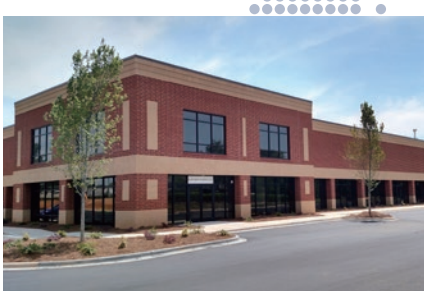
Cutting Solution Service

Machining Technology Center

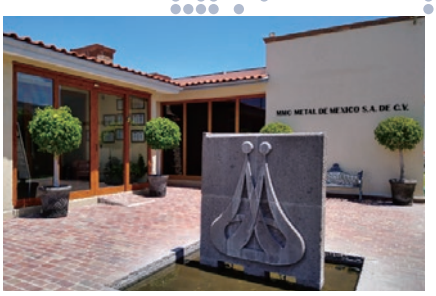
RESPONSIVE, ATTRACTIVE, PROACTIVE

Mitsubishi Materials Corporation, Metalworking Solutions Company, offers a "Comprehensive Craftsman Studio" which addresses the individual needs and requirements of our customers in order to make their business successful. Here the Machining Technology Center is the base at the front lines. It is fully equipped with advanced machines, measuring instruments, extensive cutting data, knowledge, technologies as well as having a team of highly-experienced technical staff members. All of which allows Mitsubishi Materials Corporation to offer the best solution and services for our valued customers.





MTEC North Carolina (USA)



MTEC Querétaro (MEXICO)

MTEC Saitama (East Japan Technical Center)

MTEC Gifu (Central Japan Technical Center)

MTEC TianJin (CHINA)

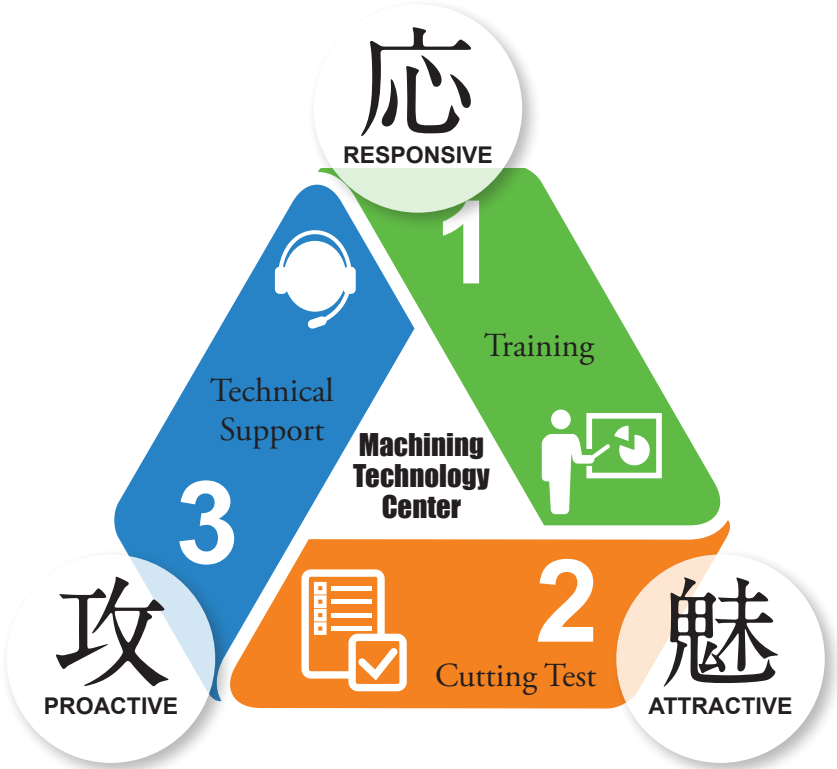
MTEC Valencia (SPAIN)

MTEC Stuttgart (GERMANY)

MTEC Bangkok (THAILAND)

MTEC Pune (India)

We try answering any questions and demands from customers around the world and providing detailed solutions as well as meeting customers' expectations along with a sustainable growth of technical skills and services.



We identify the potential needs of customers and develop innovative tools to cultivate new markets for widening future business possibilities.

Showing and demonstrating, Attractive events and practical seminars present the new possibilities in machining which evoke a feeling of curiosity.

1 TRAINING

Practical "Hands-on" training with real demonstrations

- **Cutting Academy**
- **e-learning**
- Regional seminar
- Requested Seminar

2 CUTTING TEST

Visualizing your machining

- Test Cutting
- Selection of optimal machining conditions
- Improvements in tool life and machining quality
- Predictive tests before line input
- High-speed camera/ Cutting force/ 3D measuring device etc.

3 TECHNICAL SUPPORT

"RESPONSIVE", with the provision of technical services

- Production line diagnosis/ Process improvement
- Tooling
- Cutting Simulation
- Telephone Technical Counseling

Memo

SAFETY OF CUTTING TOOL PRODUCTS

1. Use of Cutting Tool Products

Packages of Mitsubishi products carry a safety warning label. However, tools are not labeled with detailed warning instructions. Please read the "Safety of Cutting Tool Products" in this catalog before handling cutting tool products and cemented carbide materials. Moreover, as a part of your workers' safety education, please notify the contents of the "Safety of Cutting Tool Products" to all workers.

2. Basic Characteristics of Hard Tool Materials

In Terms of "Safety of Cutting Tool Products"

Hard Tool Materials : General term for tool materials like cemented carbide alloy, cermet, ceramics, sintered CBN, sintered diamond, high speed steel and alloy steel, etc.

Physical Characteristics

Appearance : Varies depending on the type of material, e.g. gray, black, gold, etc.

Smell : None

Hardness, Specific Gravity :

Hard Tool Materials	Hardness (HV)	Specific Gravity	Hard Tool Materials	Hardness (HV)	Specific Gravity
High Speed Steel (HSS)	200—1200kg/mm^2	7—9	Sintered CBN	2000—5000kg/mm^2	3—5
Cemented Carbide	500—3000kg/mm^2	9—16	Sintered Diamond	8000—12000kg/mm^2	3—5
Cermet	500—3000kg/mm^2	5—9	Alloy Steel	200—1200kg/mm^2	7—9
Ceramics	1000—4000kg/mm^2	2—7	Diamond Electroforming Product	8000—12000kg/mm^2	3—5

Constituents

Carbide, nitride, carbon nitride, oxide, W, Ti, Al, Si, Ta, B, V and metals such as Fe, Co, Ni, Cr, Mo.

3. Safety of Cutting Tool Products

○Hard tool materials have a large specific gravity. Thus, they require special attention as heavy materials when the size or quantity is large.

○Hard tool materials generates dust and mist during grinding operations or heating. This dust and mist can be harmful to the human body when coming in contact with the eyes or skin, or if substantial quantities are swallowed. When grinding and machining, it is recommended to use local exhaust ventilation and respirators, a dust protective mask, glasses, gloves and so on. If dust makes contact with the hands, thoroughly wash the affected area with soap and water. Don't eat in the exposed area, and wash hands thoroughly before eating. Remove dust from the clothing by a cleaner or washing, but don't shake off.

○Cobalt dust can affect the skin, respiratory organs and heart through repeated or prolonged contact.

○For further information, please refer to **SDS** (Safety Data Sheet).

Home page: http://www.mmus-carbide.com/download/safety/

4. Handling Cutting Tool Products

○Surface conditions affect toughness of cutting tools. Therefore, use a diamond grinding wheel for finishing.

○Hard tool materials are extremely hard and brittle at the same time. Thus, they may be broken by shock and tightening with excess force.

○Hard tool materials and ferrous materials have different thermal expansion ratios. Shrinkage or swell fit products may suffer from cracks when applied temperature is higher or lower than the appropriate temperature for the tool.

○Pay special attention regarding storing hard tool materials. Toughness of hard tool materials is lowered when they corrode due to coolant and other liquid.

○When brazing hard tool materials, if the temperature is too high or too low from the melting point of the brazing material, loosening and breakage may occur.

○After regrinding cutting tools, make sure that there are no cracks.

○Machining hard tool materials on EDM may cause cracks on the surface due to remaining electrons resulting in lowering the toughness. Eliminate cracks by grinding, etc.

SUGGESTIONS ON HOW TO USE CUTTING TOOLS

Products	Hazard	Countermeasure
All Cutting Tools	◎Cutting tools have sharp cutting edges. Handling them with bare hands may cause injuries.	* Take precautions such as wearing gloves especially when handling tools and during installation.
	◎Improper use of tools and application of inappropriate cutting conditions may cause the tool to break and be discharged from the machine providing risk of injury.	* Ensure safety guards and goggles are used. * Refer to handling explanatory notes and catalogs. Use tools under recommended cutting conditions.
	◎Impact load and rapid increase of cutting resistance due to excessive wear may cause the tool to break and be expelled from the machine providing risk of injury.	* Ensure safety guards and goggles are used. * Exchange tools before excessive wear occurs.
	◎Cutting tools and workpieces become extremely hot during cutting. Touching them with bare hands may cause burns.	* Take precautions such as wearing gloves.
	◎Expelled hot chips produced in cutting produces risk of injuries and burns.	* Ensure safety guards and goggles are used. * During swarf removal and machine cleaning ensure the machine is stopped and wear gloves. Please use tools, such as cutting nippers and cutting clippers.
	◎In cutting, sparks, hot chips and heat generation caused by tool breakage provides a risk of igniting a fire.	* Avoid using cutting tools in places where there is a possibility of igniting a fire. * In case of using non-water soluble oil, make sure to have a fire prevention countermeasure.
	◎Using machines, chucks, and tools with poor balance at high revolutions may cause tools to break providing risk of injuries.	* Ensure safety guards and goggles are used. * Check the machine for vibration, chattering, and abnormal noise.
	◎Handling machined parts with burrs using bare hands may cause injuries.	* Wear gloves.
Indexable Inserts Type Tools	◎If inserts and spare parts are not held securely, they may become loose and be ejected producing risk of injuries.	* Clean insert locating seat and spare parts before setting inserts. * Use the tool provided for setting inserts, and ensure the inserts and spare parts are clamped securely. Do not use the tool provided for things other than prescribed inserts and spare parts.
	◎Clamping inserts and spare parts too tightly by using tools such as extension pipes may cause them to break and be scattered.	* Do not use extra tools for more leverage. Only use the tool provided.
	◎When applying high cutting speed, spare parts and inserts may be expelled due to centrifugal force. Pay special attention on each safety guidline.	* Refer to the handling explanatory notes and catalogs. Use tools under recommended cutting conditions.
Cutters and Other Rotating Tools	◎Milling cutters have sharp edges. Handling them with bare hands may cause injuries.	* Take precautions such as wearing gloves.
	◎Poor balance or off center revolving of tools may cause vibration and chattering which could cause the tool to break and be discharged.	* Apply cutting speed within the range of recommended cutting conditions. * Adjust accuracy and balance of spindles and bearings periodically to prevent off center revolving and chattering caused by wear on these parts.
Drilling Tools	◎Through cutting in cases when the workpiece revolves may produce a disk shaped peice with sharp edges when the cutting tool breaks through.	* Ensure safety guards and goggles are used. Also install a cover on the chuck.
	◎Drills with an extremely small diameter have a very sharp point which may puncture the skin if not handled carefully. If the drill breaks during cutting, the broken parts may be scattered.	* Handle with care. Take precautions such as wearing gloves and goggles.
Brazed Tools	◎Weakening of the braze and breakage of inserts may cause injury.	* Before using them, ensure they are brazed securely. * Do not use them under conditions which produce very high temperature.
Others	◎Machine and tools may be damaged if they are used for purposes other than the prescribed application.	* Use them strictly for the prescribed application.

INFORMATION

This catalog completes the basic precautions for safety use of our company's products. For further information, please refer to the guideline, catalogs or contact us. We are not responsible for any accidents caused by modifying tools without our permission.

HOW TO READ THE STANDARD OF TURNING INSERTS

●How this section page is organized

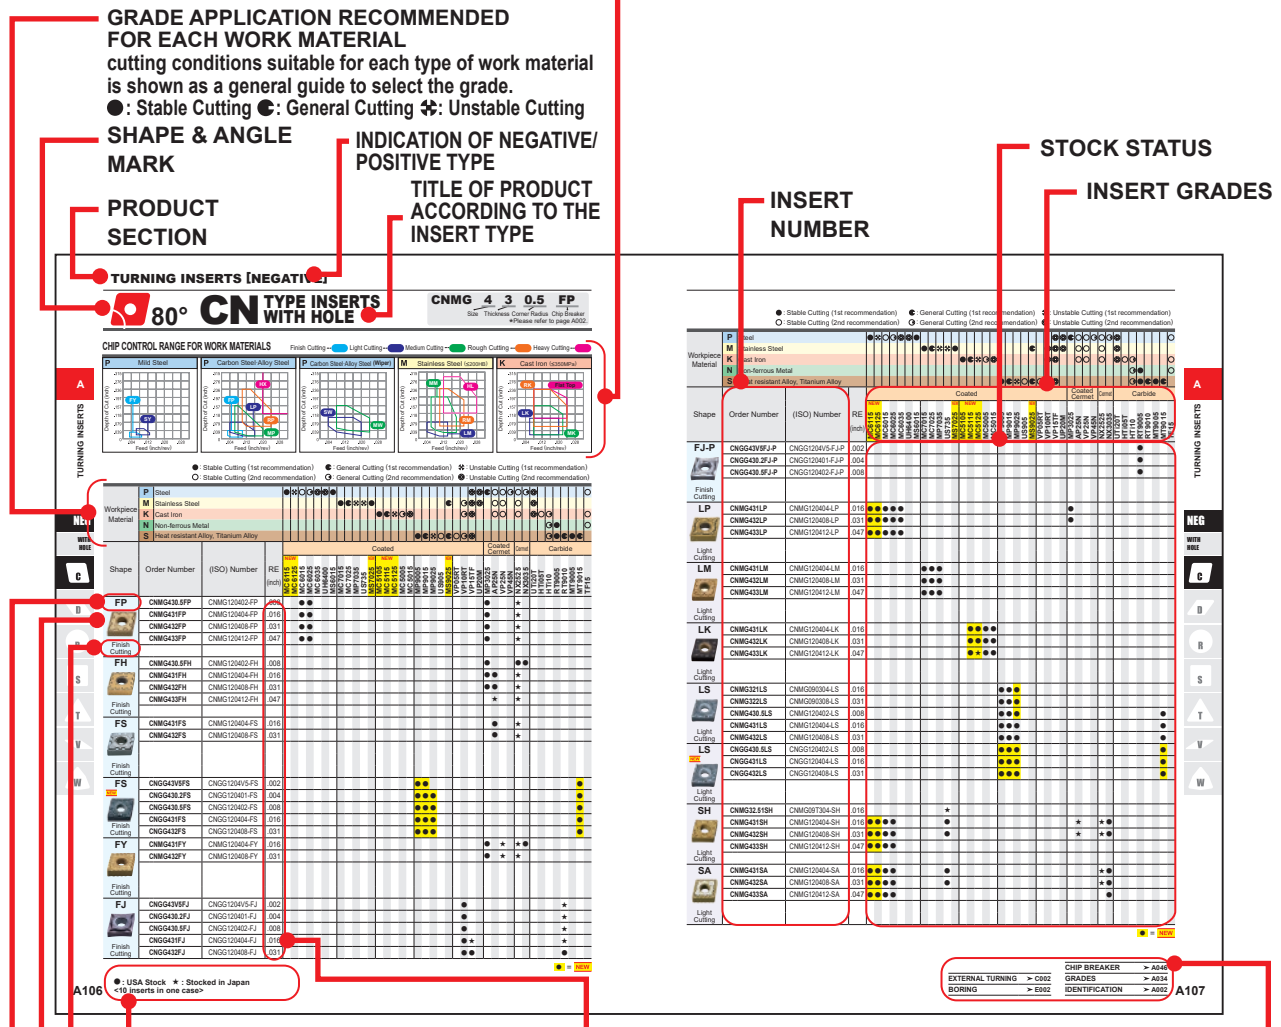
①Organized according to turning insert shape.
(Refer to the index on the next page.)
②Inserts are arranged in order of :
- Negative inserts (with hole→without hole)
- Positive inserts (with hole→without hole)

③Breakers are arranged in order of :
Finish Cutting→Light Cutting→Medium Cutting →Rough Cutting→Heavy Cutting

●Graph of chip control by work material

Shows recommended chip breakers and chip control range according to work material and cutting application.
Graphs are colored according to cutting applications (Finish→Light→Medium→Rough→Heavy) and contain recommended breakers for each application.

Finish Cutting : Light Cutting : Medium Cutting :
Rough Cutting : Heavy Cutting :



●To Order : Please specify insert number and grade.

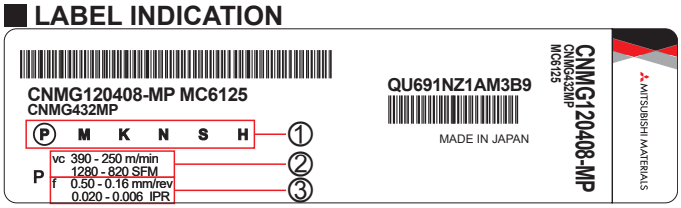
TOOL NAVI

OUTLINE

TOOL NAVI supports our customers with information and supplies suitable cutting conditions for each work material by selecting optimal indexable insert together with the optional tool.

LABEL INDICATION



*1. The above is an example. There may be inserts recommended for multiple work materials.
*2. Please contact us for recommended cutting conditions using coefficient values other than the above.

①Work materials

P : Steel (Material reference : Carbon steel, alloy steel 180HB)
M : Stainless steel (Material reference : Austenitic stainless steel 180HB)
K : Cast iron (Material reference : Gray cast iron, ductile cast iron 180HB)
N : Aluminum alloy, Non-ferrous metal
S : Material reference : Titanium alloy 320HB, Ni, Co-based alloy 400HB
H : Hardened steel 60HRC

②Cutting speed standards

Work Material	Tool Life		Work Material	Hardness
	Life	Performance		
P	90min.	15min.	Carbon steel, alloy steel	180HB
M	90min.	15min.	Stainless steel	180HB
K	90min.	15min.	Cast iron	180HB
S	25min.	5min.	Titanium alloy	320HB
			Ni, Co-based alloy	400HB
H	80min.	10min.	Hardened steel	60HRC

③Feed rate

Minimum and maximum feed rate settings are based on the chip control range of the chip breaker.

*3. N : Life based on each grade. For stable conditions choose the performance cutting speed and for unstable choose the tool life feed rate.
*4. The tool life is based on the following (VB wear). Some materials include elements other than this.
PMKS • • • VB=0.3 mm
H • • • VB=0.1 mm

TOOL LIFE

Cutting speed has a large affect on tool life. **TOOL NAVI** is based on Taylor's equation (relationship vc x Tn=C between tool grade, cutting conditions, and tool life). Therefore, performance speed and tool life is found for each work material. When the customer requires different tool life, obtain coefficient values of the grade you use from the charts below. Multiply the coefficient values by the cutting speed to calculate the new cutting speed.

● P Grade (Steel) cutting speed coefficient values.

Grade \ Tool life	15min	30min	45min	60min	90min
MC6115	1.00	0.82	0.72	0.67	0.59
MC6125	1.00	0.83	0.75	0.69	0.62
MP3025	1.00	0.85	0.77	0.72	0.65
NX2525	1.00	0.87	0.80	0.76	0.70

● K Grade (Cast Iron) cutting speed coefficient values.

Grade \ Tool life	15min	30min	45min	60min	90min
MC5115	1.00	0.79	0.69	0.62	0.54
MC5125	1.00	0.76	0.65	0.58	0.50

(ex.) Medium cutting of steel
The 1st recommendation : MC6125
Indexable inserts : CNMG432MA
Recommended cutting speed : vc = 1280 SFM
(Tool life : 15min.)

↓

Tool life required by the customer : 30min.
1280×0.83≒1062 SFM

● M Grade (Stainless Steel) cutting speed coefficient values.

Grade \ Tool life	15min	30min	45min	60min	90min
MC7015	1.00	0.83	0.75	0.70	0.63
MC7025	1.00	0.90	0.84	0.80	0.75
MP7035	1.00	0.84	0.76	0.71	0.62
US735	1.00	0.78	0.68	0.61	0.53

HARDNESS OF WORKPIECE

Hardness of the work material also affects tool life. Mitsubishi's **TOOL NAVI** suggests cutting speed variations when hardness of the work material differs. Obtain the suitable coefficient value for each work material from the chart below. Multiply the coefficient value by the recommended cutting speed of the grade you use to calculate the new cutting speed.

Work Material	Soft ← (Hardness of work material) → Hard											
	120HB	140HB	160HB	180HB	200HB	220HB	240HB	260HB	280HB	300HB	320HB	340HB
P	1.34	1.19	1.08	1.00	0.92	0.85	0.80	0.75	0.71	0.68	0.64	0.61
M	1.41	1.23	1.10	1.00	0.91	0.85	0.78	0.72	0.68	0.64	0.61	0.58
K	1.27	1.19	1.09	1.00	0.97	0.91	0.88	0.85	0.81	0.78	0.75	0.72

OPTIMUM GRADES AND CHIP BREAKERS FOR EXTERNAL TURNING

● Selection of optimum inserts for turning
The following diagrams show for each work material, the optimal combination of suitable grades and chip breakers for each application area in turning.

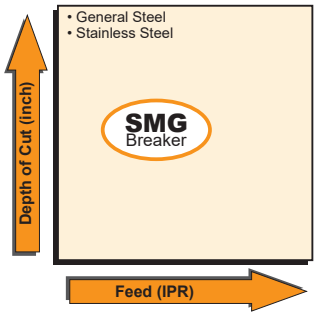
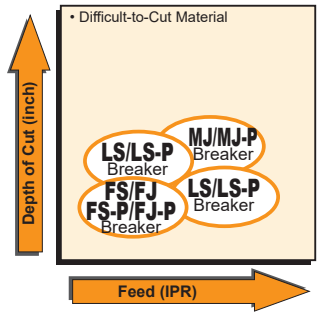
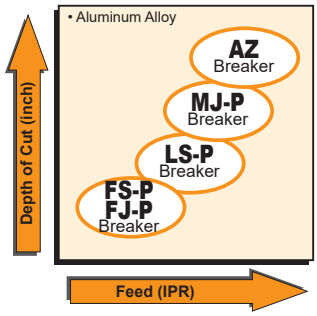
3D MOLDED CHIP BREAKERS (POSITIVE INSERTS)

■CHIP CONTROL RANGE







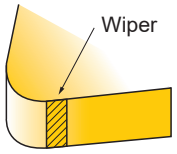
■FEATURES OF CHIP BREAKER

Breaker	Features	CCGT Type	DCGT Type	TCGT Type	VCGT Type	WCGT/RCGT Type
FS	● Ideal for heat-resistant alloys, titanium alloys, and cobalt chrome alloys. ● Sharp cutting edges provide excellent surface precision and finish.			—	—	—
FS-P	● Ideal for titanium alloys and copper alloys. ● Sharp cutting edges provide excellent surface precision and finish.			—	—	—
FJ	● The curved cutting edges support changes in cutting depth-smooth chip discharge and disposal. ● The large rake angle highly suitable for finishing difficult-to-cut materials.			—	—	—
FJ-P	● Ideal for aluminum and copper. ● The sharp edge produces excellent surface finishes.				—	
LS	● Ideal for heat-resistant alloy and titanium alloy and cobalt chrome alloy. ● Breaker protrusion suitable for depth of cut area achieves a wide range of chip control.			—		—
LS-P	● Ideal for aluminum and copper. ● The polished insert face prevents built up edge.			—		—
MJ	● The curved cutting edges support changes in cutting depth-smooth chip discharge and disposal. ● Large rake angle highly suitable for finish- light cutting difficult-to-cut materials.				—	
MJ-P	● Ideal for aluminum and copper. ● The sharp edge produces excellent surface finishes.				—	
SMG	● For medium cutting. ● 3D molded chipbreaker provides good chip control.Breaker geometry appropriate for copying and back turning.			—	—	—
AZ	● The high rake angle and 3D curved cutting edge provides sharpness at the cutting point. ● Additionally the 3D shape of the rake face enables excellent chip control.					

WIPER INSERT

What is a Wiper Insert?

- The wiper insert is designed with a wiper edge that is situated where the straight edge meets the corner radius.
- In comparison to conventional breakers, the surface finish does not deteriorate even if the feed rate is doubled.
- Machining at high feed rates improves cutting efficiency.



●Improving Surface Finish
Under the same machining conditions as conventional breakers, but with the feed rate increased, the surface finish of the work material can be improved.

●Improving Efficiency
High feed rates not only shortened machining times but also make it possible to combine roughing and finishing operations.

●Increased Tool Life
When a change to high feed conditions, the time required to cut one component is decreased, thus more parts can be machined with each insert. In addition, the high feed rate prevents rubbing, therefore, delaying the progression of wear and increasing the tool life of the insert.

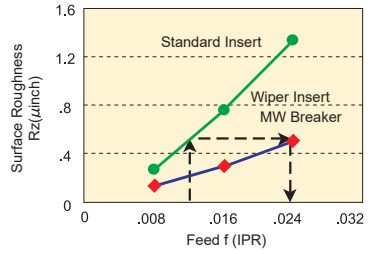
●Improving Chip Control
Under high feed conditions, the chips generated become thicker and are more easily broken, thus, chip control is improved.

Wiper insert + High feed (The feed rate is doubled.)

Finished surface Same surface roughness =

Standard insert + The conventional feed condition

*Please use a wiper insert at high feed rate.



<Cutting Condition>
Work material : AISI 1045
Insert : CNMG432□□
Cutting Speed=655 SFM
Depth of Cut=.059 inch
Feed rate=.008—.024 IPR
with flood coolant

<Ex>The surface roughness does not deteriorate even if the feed rate is doubled (.012"→.024")!

■A wiper insert + machining at high feed rate
- Reduced machining time (per work material)
- Increased number of work material (per definitive time period)
- Improving chip control

■A wiper insert + machining at conventional feed rate
- Eliminating the finishing step by roughing and finishing together (Separate roughing and finishing steps → Single-step machining)

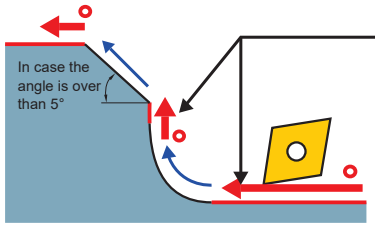
- Reducing cycle times
- Increased productivity
- Avoiding Line-Stoppage

<The Realization of Reduced Costs!!>

■ The estimate of finished surface roughness when using a wiper insert

The effects of wiper inserts on external machining, boring and facing.

*The surface roughness when machining at corner R or taper angle over 5°, is the same as machining with standard inserts.



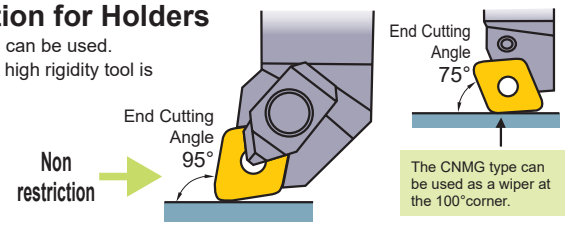
Rz(W)=Rz×0.5

Rz(W) = Finished surface roughness when using a wiper insert.
Rz : Finished surface roughness from conventional conditions. (When using a standard insert)

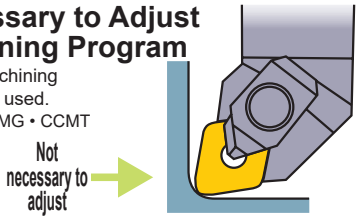
Effective uses of a wiper insert
Non effective uses of a wiper insert

■ Special attention is not necessary when using CNMG • WNMG • CCMT types

●No Restriction for Holders
A standard holders can be used.
(*A double clamp, high rigidity tool is recommended.)



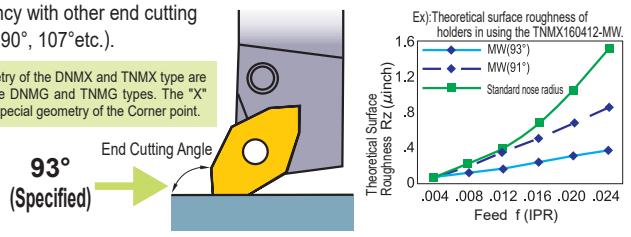
●Not Necessary to Adjust the Machining Program
Conventional machining programs can be used.
(The CNMG • WNMG • CCMT types are based on the ISO/ANSI.)



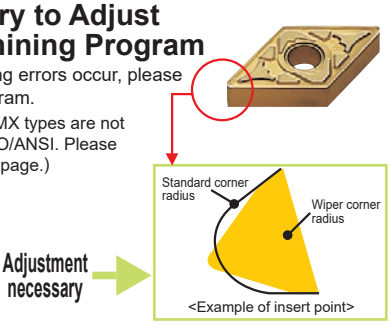
■ Special attention is necessary when using the DNMX • TNMX types due to the special top face geometry

●Restriction for Holders
Use a holder with end cutting angle 93° for improving wiper efficiency. A holder with end cutting angle 91° can improve wiper efficiency (see the following figure), however, there is no wiper efficiency with other end cutting angles (60°, 90°, 107°etc.).

The hole geometry of the DNMX and TNMX type are the same as the DNMG and TNMG types. The "X" represents the special geometry of the Corner point.



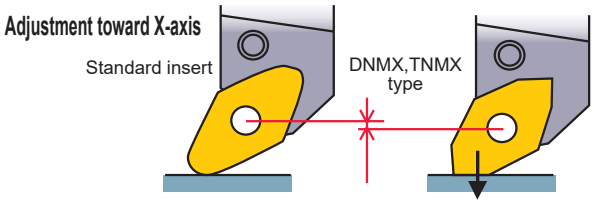
●Necessary to Adjust the Machining Program
When machining errors occur, please adjust the program.
(The DNMX•TNMX types are not based on the ISO/ANSI. Please refer to the next page.)



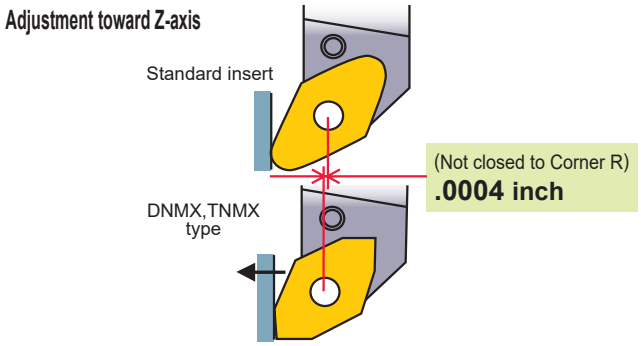
■Adjustment of machining programs for DNMX • TNMX types

Basic Process) Adjusting Toward X-axis and Z-axis

Adjusting the differential between a standard insert and Z-axis / X-axis.



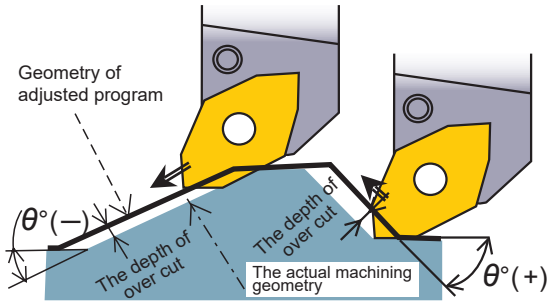
Corner radius .016",.031" : **.0016 inch**
Corner radius .047" : **.0020 inch**



A) Adjusting a Taper ⁎Necessary to maintain a correct taper.

Adjust the relief angle toward the normal line.

Note1) Adjust the angle toward the normal line in the case where the adjustment number is minus (θ =60°—70°) and is not machined completely.



Classification

Nose Radius	Taper Angle θ°															
	-25—-15	-10	-5	**0**	5	10	15	20—35	40	45	50	55	60—65	70	75—85	**90**
.047	.0016	.0012	.0004	**0**	.0008	.0012	.0016	.0020	.0016	.0016	.0008	.0004	-.0004	0	.0004	**0**
.031	.0012	.0008	.0004	**0**	.0004	.0008	.0012	.0016	.0012	.0012	.0008	0	-.0004	0	.0004	**0**
.016	.0008	.0004	.0004	**0**	.0004	.0004	.0008	.0008	.0008	.0004	.0004	0	-.0004	-.0004	0	**0**

Values→+numbers:adjustment of relief angle, -numbers:adjustment of plunge in angle (inch)

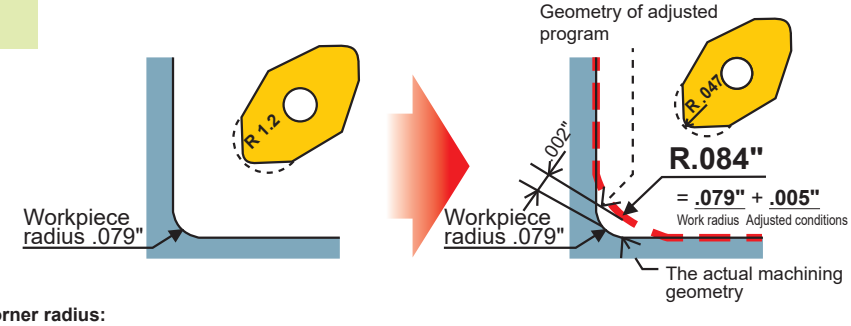
B) Adjusting a Corner R ⁎Necessary to maintain a correct corner radius.

Adjust the work diameter same as the taper to prevent over-cut.

The value of adjustment to work R
= Work R + the adjustment value
⁎No adjusting the corner radius in this case.

The corner radius of the insert	The adjustment amount on the workpiece radius.
Corner Radius .016" →	Work Radius**+.0020"**
Corner Radius .031" →	Work Radius**+.0043"**
Corner Radius .047" →	Work Radius**+.0055"**

Ex) : In case of machining R .079" when using a corner R .047" type insert.



The Easy-to-correct Method

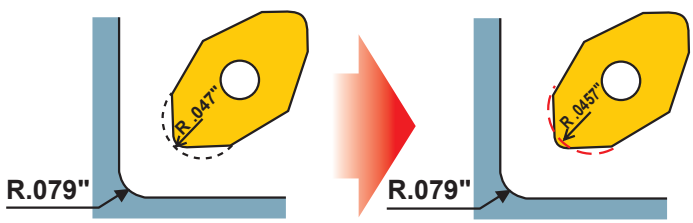
In correcting corner radius:
It is not necessary to adjust the machining program, however, machining errors can occur within max. ± .0012" due to correcting by an approximate number.

Corner Radius Correction Input the correction number of each corner radius.

The value of corrected corner radius
= approximation
⁎No adjustment required in machining program.

The corner radius of a insert	The value of corrected corner radius = approximation
Corner Radius .016" →	**R.0142"**
Corner Radius .031" →	**R.0299"**
Corner Radius .047" →	**R.0457"**

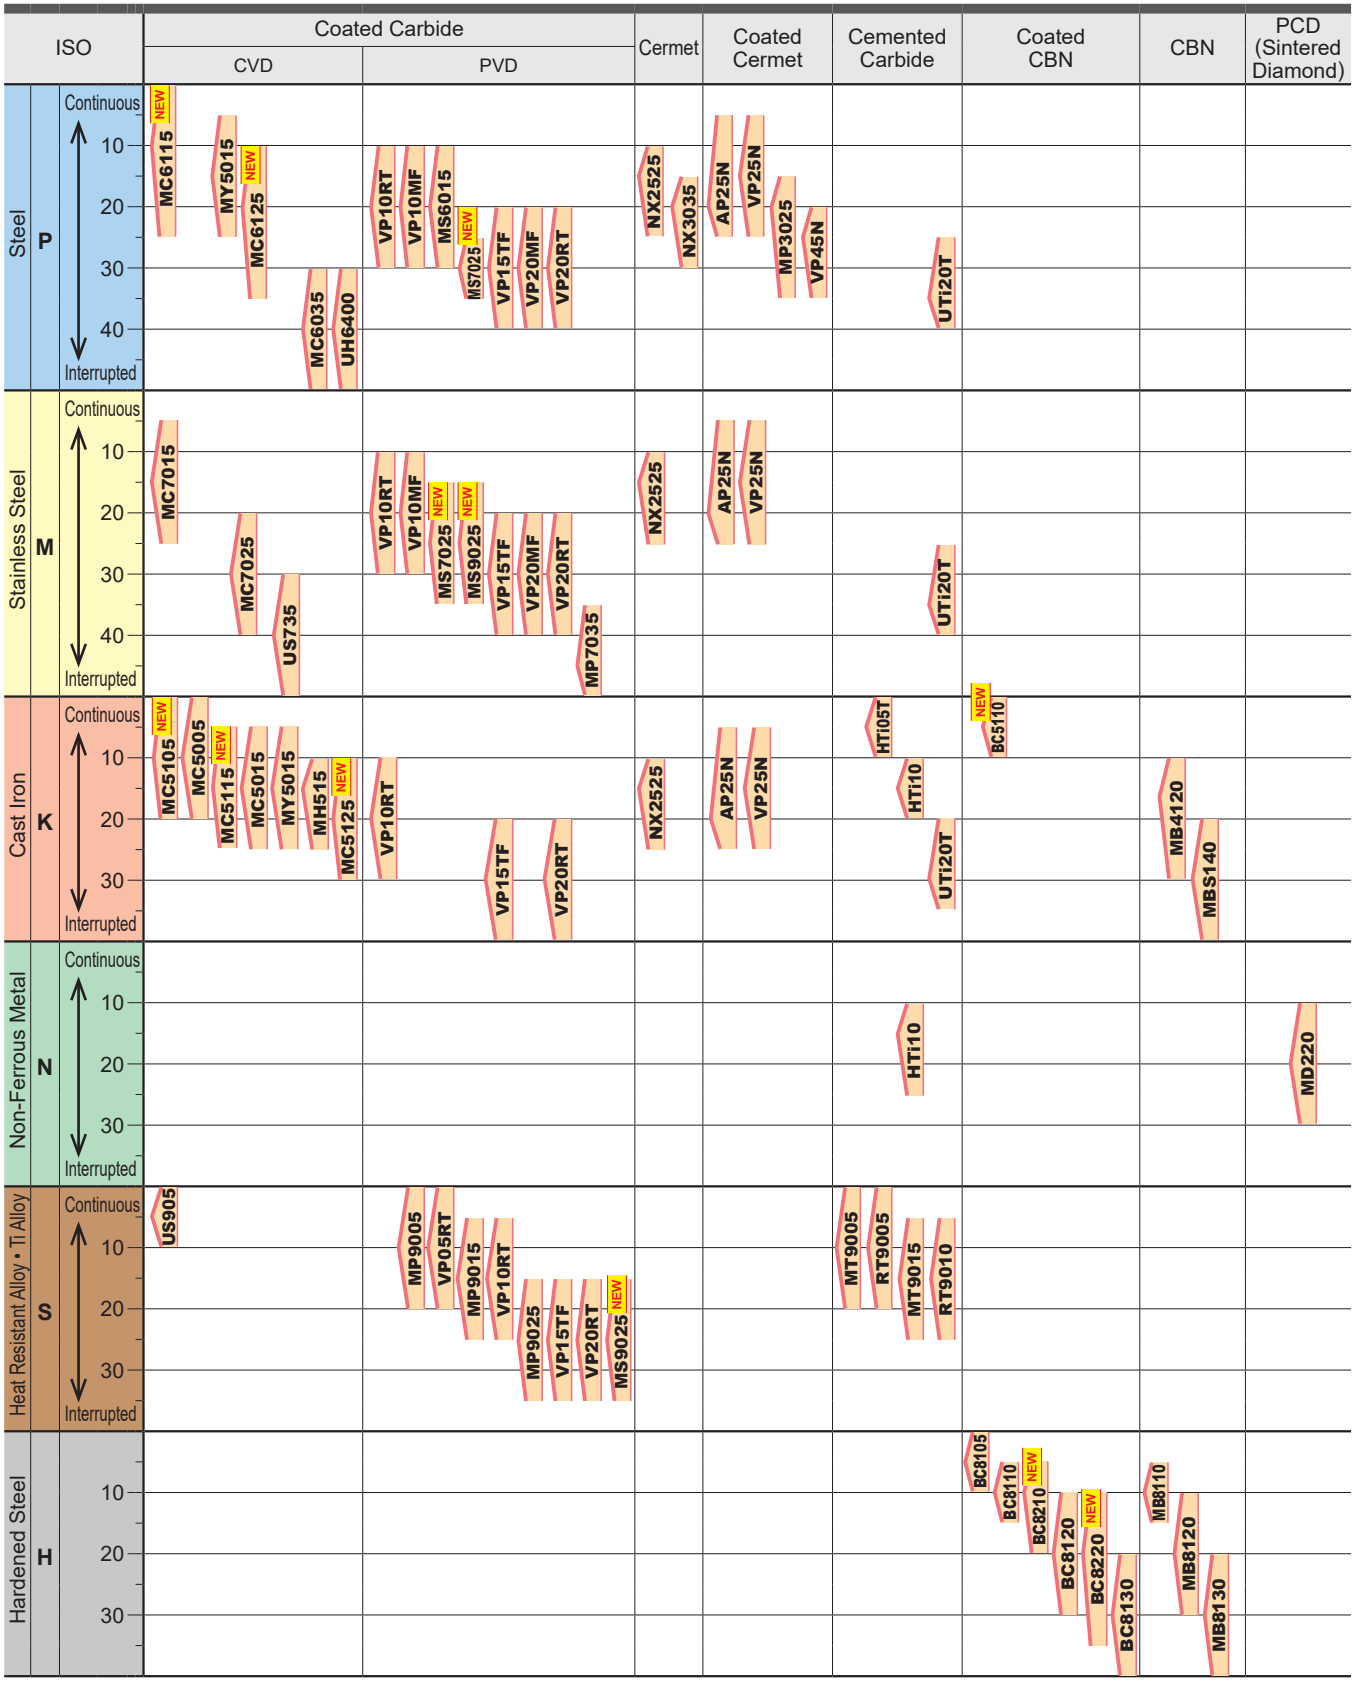
Ex):In the case of machining a corner with a radius R .079" when using an insert with a corner radius R .047".



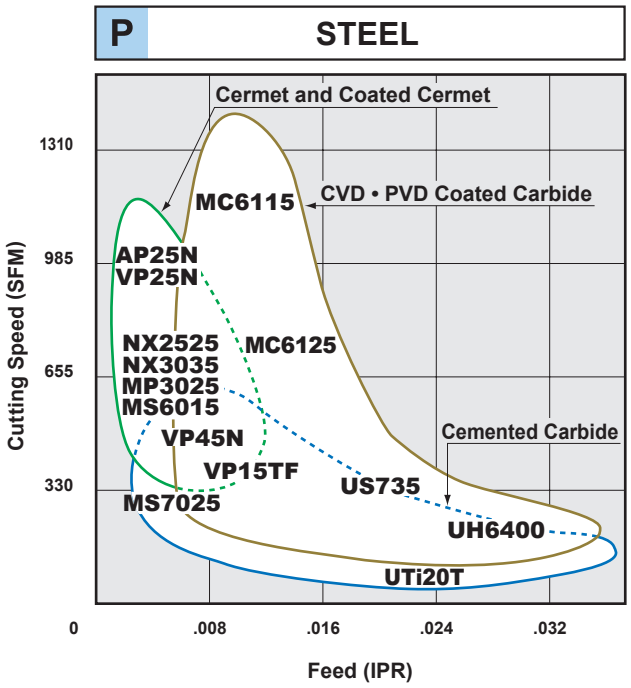
Others) The value of correction is same for both DNMX and TNMX. Discriminate them by the size of corner radius.

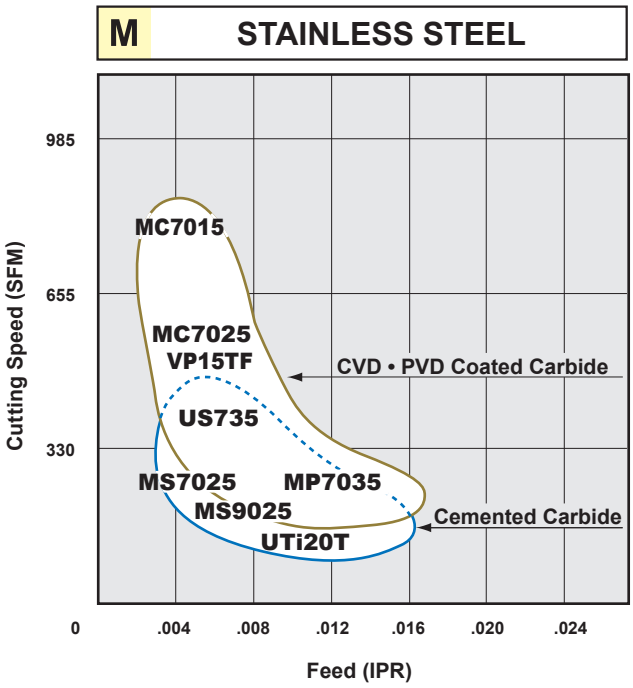
GRADES FOR TURNING

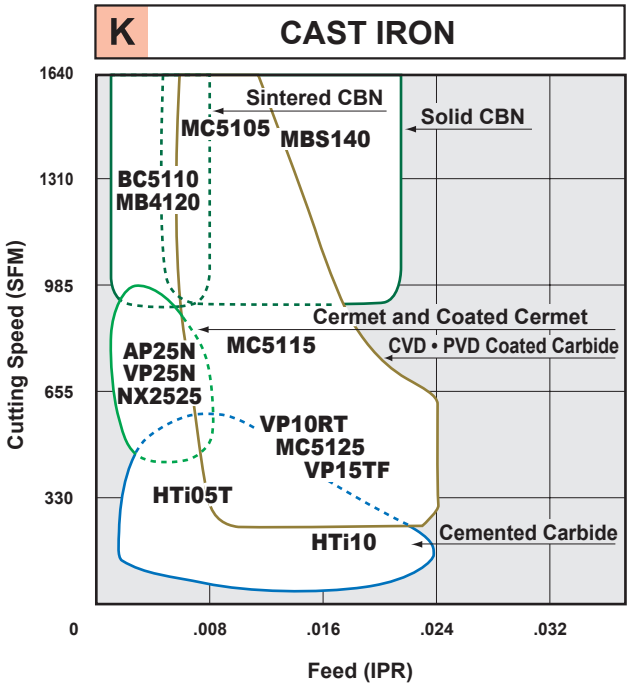
●INDEXABLE INSERT GRADES FOR TURNING

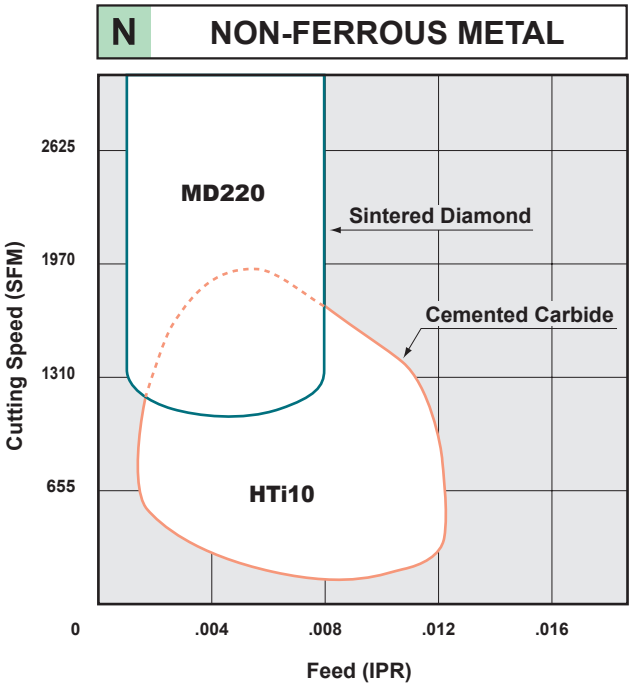


TURNING APPLICATION RANGE





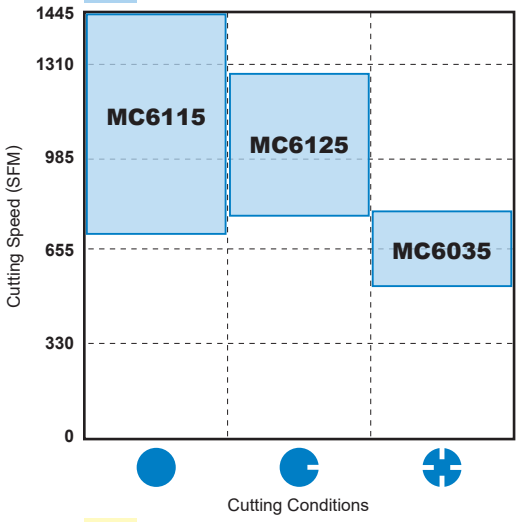




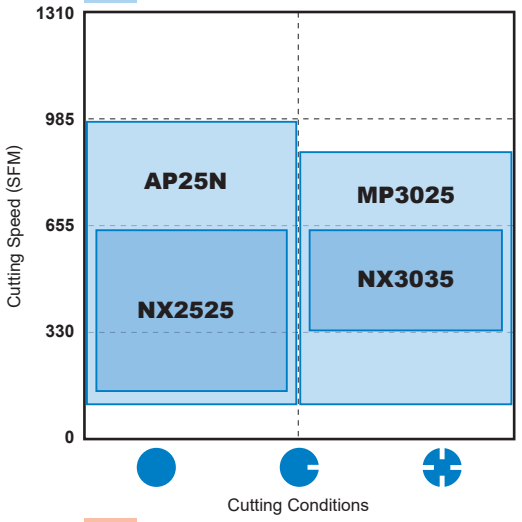
TURNING APPLICATION RANGE

●Recommendation of the insert grade based on cutting speed and conditions for each work material.

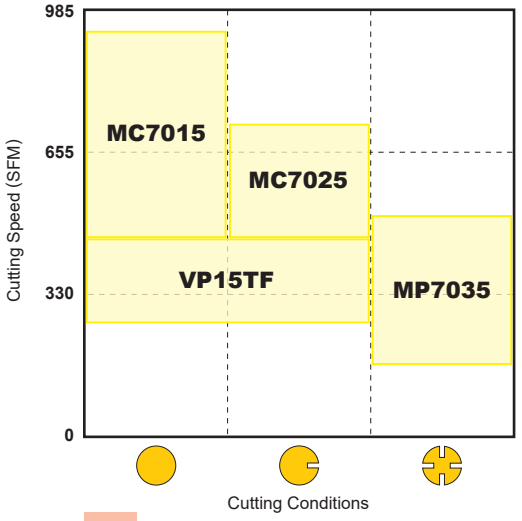
P STEEL (Medium-Rough Cutting)



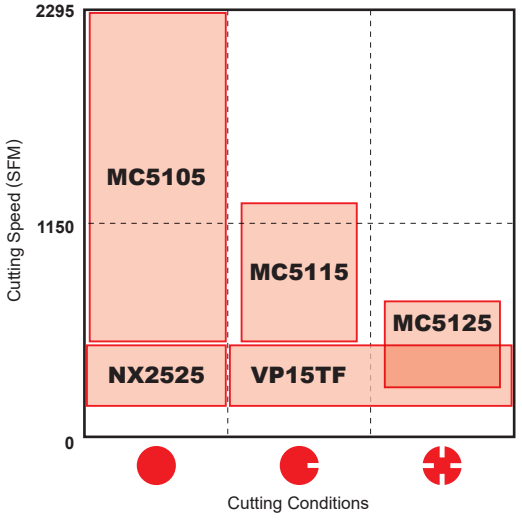
P STEEL (Finish Cutting)



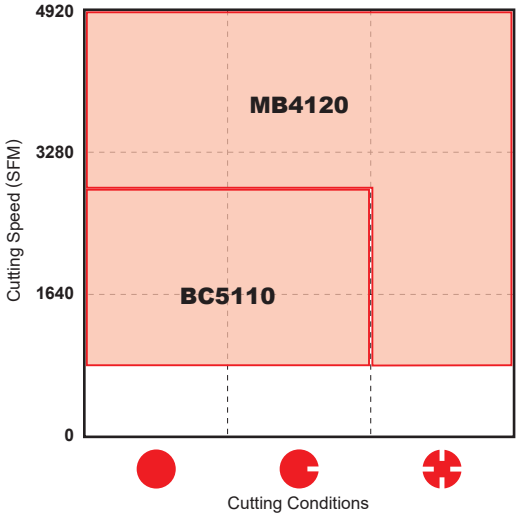
M STAINLESS STEEL



K CAST IRON



K CAST IRON (CBN)



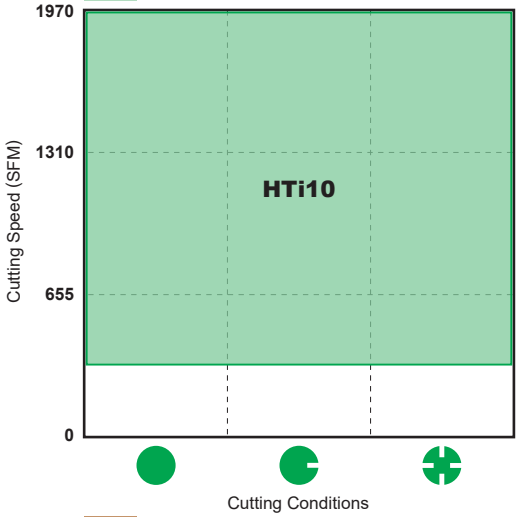
CUTTING CONDITIONS

Stable Cutting — Continuous Cutting, Constant Depth of Cut, Pre-Machined, Securely Clamped Component

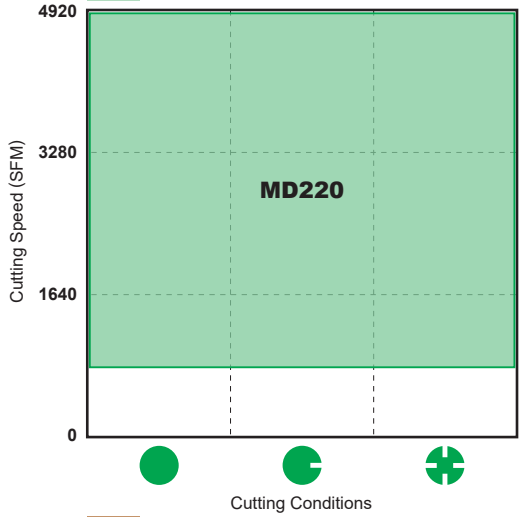
Unstable Cutting — Heavy Interrupted Cutting, Irregular Depth of Cut, Low Clamping Rigidity

General Cutting

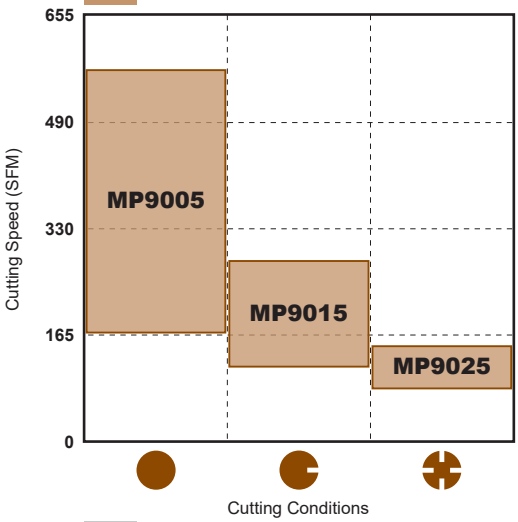
N NON-FERROUS METAL



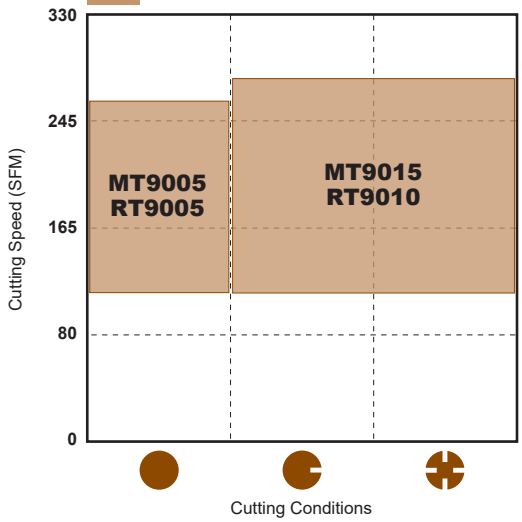
N NON-FERROUS METAL (PCD)



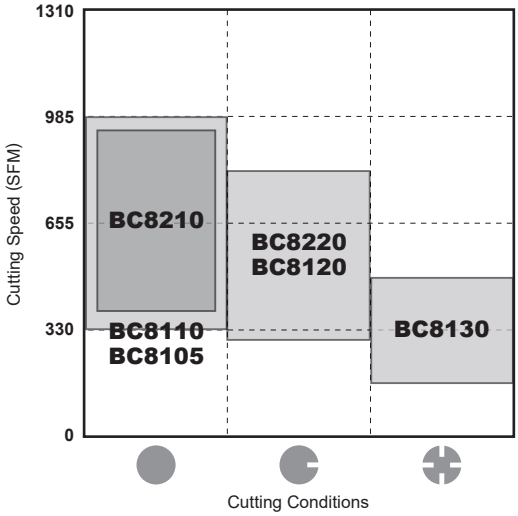
S HEAT RESISTANT ALLOY



S TITANIUM ALLOY



H HARDENED MATERIALS (CBN)



COATED CARBIDE (CVD)

- Special tough fibrous structure improves wear and fracture resistance.
- It covers a wide application range and thus reduces the number of tools required.

■ SELECTION STANDARD

●TURNING

	Work Material	Cutting Mode	Recommended Grade	Recommended Cutting Speed (SFM)
P	Steel	Continuous Cutting	NEW MC6115	1115 (705 — 1575)
			NEW MC6125	1080 (690 — 1525)
		Interrupted Cutting	MC6035	490 (260 — 665)
M	Stainless Steel	Continuous Cutting	MC7015	720 (510 — 935)

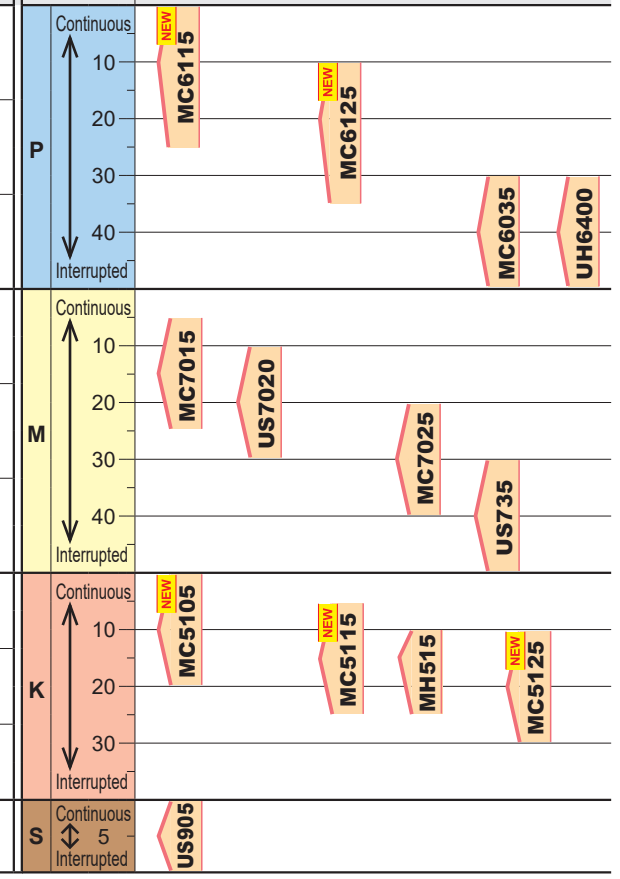
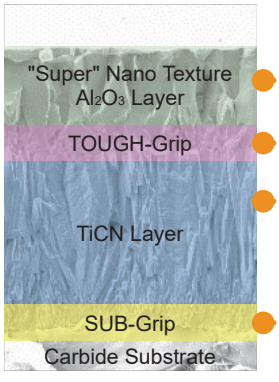
K	Cast Iron Ductile Cast Iron	Continuous Cutting	NEW MC5105	1418 (540 — 2295)
			NEW MC5115	875 (490 — 1260)
		Interrupted Cutting	NEW MC5125	490 (260 — 720)
S	Heat Resistant Alloy	Continuous and Interrupted Cutting	US905	70 (45 — 95)



MC5115



- Al_2O_3 layer with excellent wear resistance
- Intermediate layer with microstructure suitable for ductile cast iron
- Thick TiCN layer suitable for coping with the hardness of ductile cast iron
- New adhesion layer with an enhanced resistance to peeling

Tough and Sub Grip Layers for Ductile Cast Iron Grades

The extra strength of the adhesion between the coating layers (1.3 times stronger) suppresses peeling during machining of ductile cast iron.

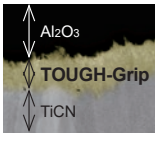
Adhesion is 1.3 Times* Greater!

MC5115

*Compared with a conventional Mitsubishi product.

TOUGH-Grip

The interface between the layers is controlled at the nano level, allowing the TOUGH-Grip layer extremely high levels of adhesion to prevent delamination.



SUB-Grip

By increasing the degree of adhesion between the carbide substrate and the coating layer, a coating layer has been developed that is resistant to peeling even during strong intermittent machining.

By Image

■ GRADE CHARACTERISTICS

Workpiece Material		Grade	Substrate	Coating Layer	
			Hardness (HRA)	Composition	Thickness
P	Steel	NEW **MC6115**	90.8	Accumulated TiCN-Al_2O_3-Ti Compound	Thick
		NEW **MC6125**	90.0	Accumulated TiCN-Al_2O_3-Ti Compound	Thick
		UH6400	89.5	Accumulated TiCN-Al_2O_3-Ti Compound	Thick
M	Stainless Steel	**MC7015**	90.7	TiCN-Al_2O_3-TiN	Thin
		US7020	90.5	TiCN-Al_2O_3-TiN	Thin
		MC7025	89.4	TiCN-Al_2O_3-TiN	Thin
		US735	89.0	Ti Compound	Thin
K	Cast Iron Ductile Cast Iron	NEW **MC5105**	91.0	TiCN-Al_2O_3	Thick
		NEW **MC5115**	91.0	TiCN-Al_2O_3	Thick
		NEW **MC5125**	91.0	TiCN-Al_2O_3	Thick
	Heat Resistant Cast Steel	**MH515**	91.0	TiCN-Al_2O_3	Thick
S	Heat Resistant Alloy	**US905**	92.2	TiCN-Al_2O_3-TiN	Thin

Note 1) Hardness shows representative value of the substrate.

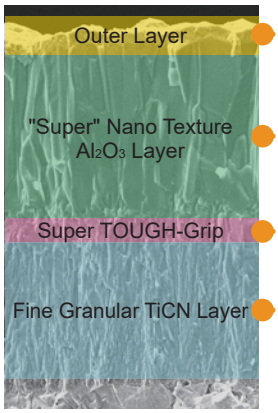
■ Super Nano Texture Technology

The standard Nano Texture Technology has been improved and developed to be an industry leading standard for crystal growth of Al_2O_3 coatings. This Super Nano Texture Technology increases tool life and wear resistance due to the fine, dense crystal growth process.

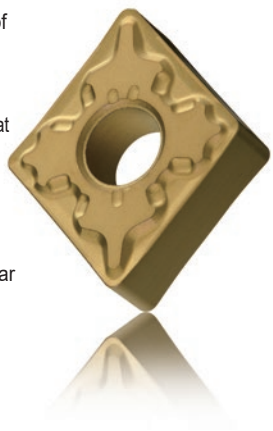
■ Super TOUGH-Grip

The Super TOUGH-Grip layer has finer crystal grains that enhance the strength of the adhesion between the coating layers.

MC6115



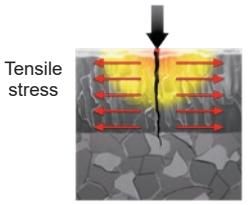
- Outer Layer: Gold color assists easy identification of edge use.
- "Super" Nano Texture Al_2O_3 Layer: Outstanding wear resistance especially at high temperatures.
- Super TOUGH-Grip: Strong adhesion between the tough coating layers.
- Fine Granular TiCN Layer: Coating for high wear resistance.



Reducing the effect of severe fracturing

Cracks that occur during unstable machining are prevented due to the relaxing of the tensile stress in the coating. MC6100 series has an 80% reduction in coating tensile stress compared to conventional CVD inserts.

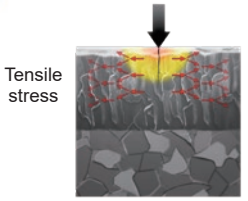
Impact stress when interrupted cutting



Conventional CVD Inserts

Cracks are generated in the surface of coatings during machining. They propagate through the coating into the substrate due to the large tensile stress in the coating structure. This creates one of the main causes of sudden insert breakage.

Impact stress when interrupted cutting



MC6100 Series

Relaxing of the Tensile Stress

MC6100 series has a much lower level of stress than conventional CVD coatings due to the surface treatment. This divides the force of impacts during machining and protects from sudden fracturing.

COATED CARBIDE (PVD)

- PVD coating prolongs tool life under the same cutting conditions compared to uncoated carbide.
- Coating of tools with sharp edges is possible without softening or changing the edge quality of the substrate.

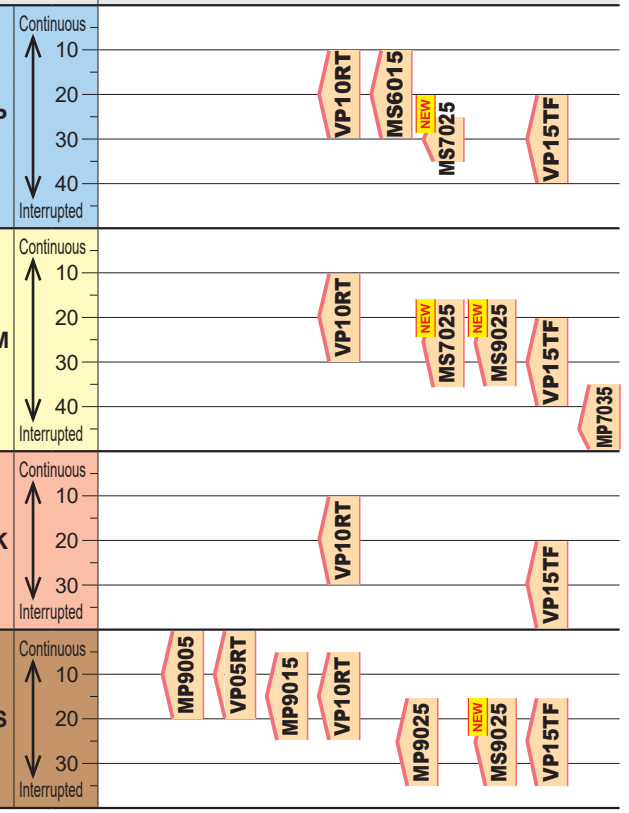
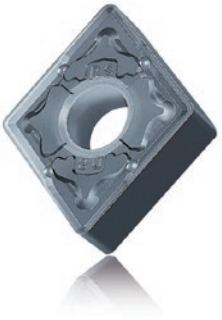
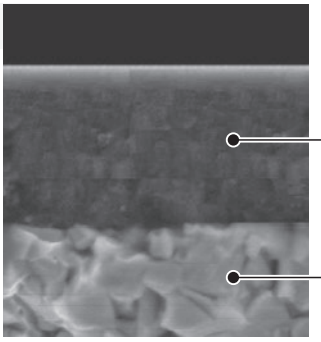
		MP9025	100 (80 — 150)



ISO Turning Inserts for Difficult to Cut Materials

MP9005/MP9015/MP9025





ISO Grade	Grade	Concept	Application
S01	**MP9005**	Top-quality grade focusing on wear resistance	Heat Resistant Alloy Finish-Medium Cutting
S10	**MP9015**	First recommendation for general applications	Heat Resistant Alloy Medium-Rough Cutting
S30	**MP9025**	Prevents severe damage for increased stability	Heat Resistant Alloy Interrupted • Light-Rough Cutting

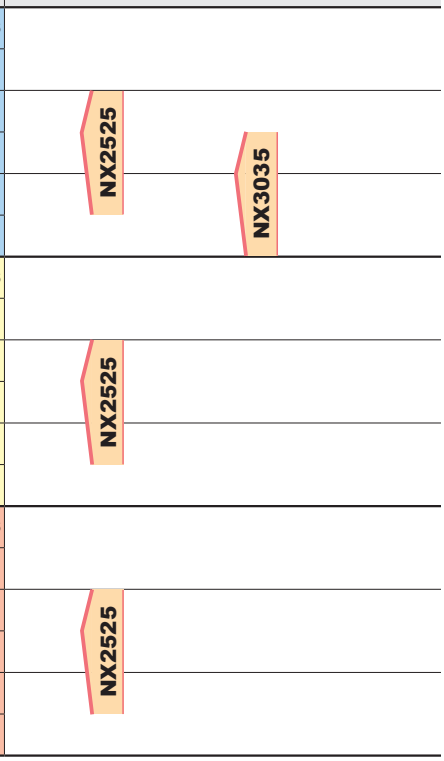
CERMET

- The optimized alloy structure and special alloy binder improves both wear and fracture resistance.
- It covers a wide application range and reduces the number of tools required.
- NX3035 for wet cutting.
- NX2525 for dry cutting.

■SELECTION STANDARD

●TURNING

	Work Material	Cutting Mode	Recommended Grade	Recommended Cutting Speed (SFM)	ISO	Application Range
P	Steel	Continuous Cutting	**NX2525**	755 (575 — 985)	P	NX2525
		Interrupted Cutting	**NX3035**	720 (560 — 935)		NX3035
M	Stainless Steel	Continuous Cutting	**NX2525**	330 (210 — 440)	M	NX2525
K	Cast Iron Ductile Cast Iron	Finishing	**NX2525**	560 (425 — 690)	K	NX2525



■GRADE CHARACTERISTICS

Grade	Hardness (HRA)
NX2525	92.2
NX3035	91.5

Note 1) Hardness shows representative value of the substrate.

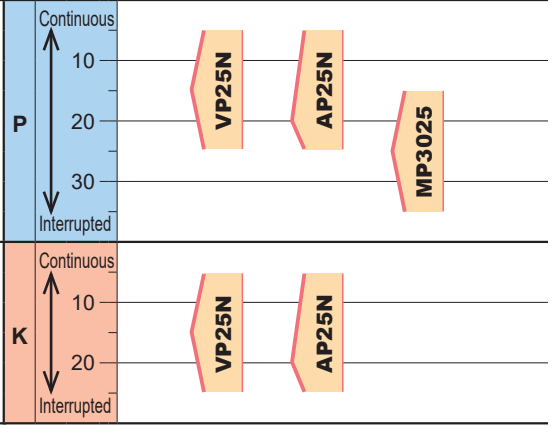
COATED CERMET

●Coated cermet (PVD coating) has superior wear and fracture resistance, and therefore provides a stable cutting performance.

■SELECTION STANDARD

●TURNING

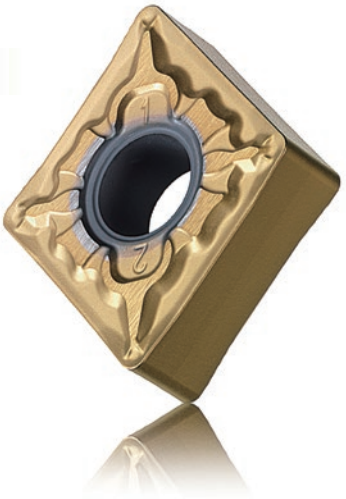
	Work Material	Cutting Mode	Recommended Grade	Recommended Cutting Speed (SFM)
P	Steel	Continuous Cutting	**VP25N AP25N**	885 (655 — 1130)
		Interrupted Cutting	**MP3025**	820 (590 — 1080)
K	Cast Iron Ductile Cast Iron	Finishing	**VP25N AP25N**	620 (510 — 740)

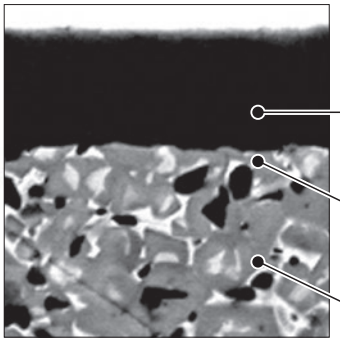


Effective for production of small parts.

MP3025

MP3025 provides improved adhesion for coating layer due to the newly-developed special substrate. Uniform flank wear allows prolonged machining that maintains excellent surface finish.





Ti-compound PVD coating provides excellent wear and welding resistance.

Substrate surface provides excellent adhesion strength for coating layer.

Substrate with superior fracture resistance and thermal shock resistance.

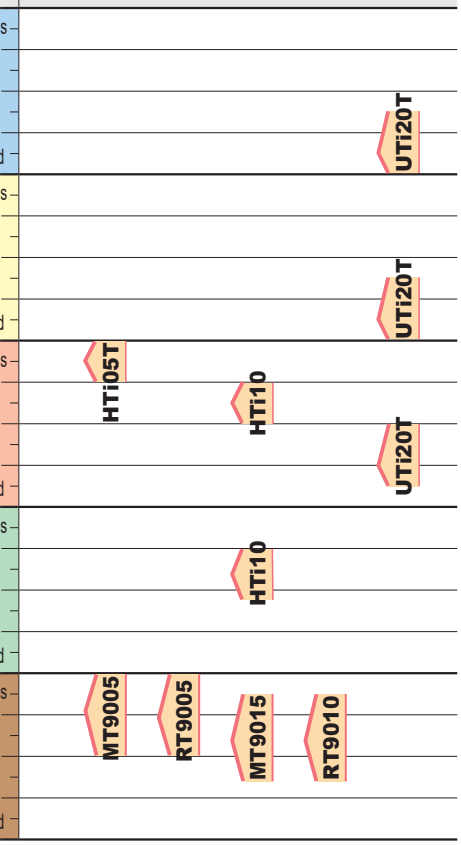
CEMENTED CARBIDE

●UTi grades are available for steel and cast iron. HTi grades are available for non-ferrous and non-metal materials and are also suitable for cast iron.

■SELECTION STANDARD

●TURNING

Work Material		Recommended Grade	Recommended Cutting Speed (SFM)	ISO	Application Range
P	Steel	**UTi20T**	360 (295 — 425)	P	UTi20T
M	Stainless Steel	**UTi20T**	330 (260 — 375)	M	UTi20T
K	Cast Iron	**HTi05T**	395 (260 — 540)	K	HTi05T
		HTi10	330 (245 — 440)		HTi10
		UTi20T	260 (195 — 360)		UTi20T
N	Non-Ferrous Metal	**HTi10**	1640 (985 — 2295)	N	HTi10
S	Heat Resistant Alloy Ti Alloy	**MT9005 RT9005**	165 (115 — 260)	S	MT9005 RT9005 MT9015 RT9010
		MT9015 RT9010	195 (115 — 280)		



■MAIN COMPONENT AND APPLICATION

ISO	Main Component	Characteristics	Work Material
P M	WC-TiC-TaC-Co	Heat / deformation resistance.	Carbon steel, alloy steel, stainless steel and cast iron
K N	WC-Co	High rigidity and wear resistance.	Cast iron, non-ferrous metals, and non-metal
S	WC-Co	High heat resistance and wear resistance.	Heat resistant alloy, Ti alloy

■GRADE CHARACTERISTICS

ISO	Grade	Hardness (HRA)
P M	**UTi20T**	90.5
K N	**HTi05T**	92.5
	HTi10	92.0
S	**MT9005/RT9005**	92.2
	MT9015/RT9010	92.0

Note 1) Hardness shows representative value of the substrate.

MICRO-GRAIN CEMENTED CARBIDE

● Compared to general cemented carbide, micro-grain alloy has higher wear resistance and higher toughness.

SELECTION STANDARD

Cutting Tool	Recommended Grade	Work Material
Turning Inserts Milling Inserts Carbide Drills	**TF15**	Steel Cast Iron

GRADE CHARACTERISTICS

Grade	Grade Characteristics *		ISO	Wear Resistance	Fracture Resistance	Corrosion Resistance
	Hardness (HRA)	T.R.S (Gpa)				
TF15	91.0	4.0	K20	◎	○	◎

* After HIP

Note 1) Hardness shows representative value of the substrate.

Finish Cutting	G Class	**R/L**	**Chip breaker for finishing** A parallel chip breaker. Good chip control for low to medium feed rates.	  SPGR321R
Light to Medium Cutting	M Class	**Standard**	**Chip breaker for light to medium cutting of carbon steel, alloy steel and stainless steel** Standard, general purpose chip breaker.	  SPMR322
For Cast Iron	M Class	**Flat Top**	**Chip breaker for heavy cutting of cast iron** Flat top. Most effective for unstable machining due to high edge strength and stable insert clamping.	 SPMN322
For Cast Iron	G Class	**Flat Top**	**Chip breaker for heavy cutting of cast iron** Flat top. Most effective for unstable machining due to high edge strength and stable insert clamping. Can be used on workpieces requiring close tolerances due to G class insert tolerance.	 SPGN322

Memo

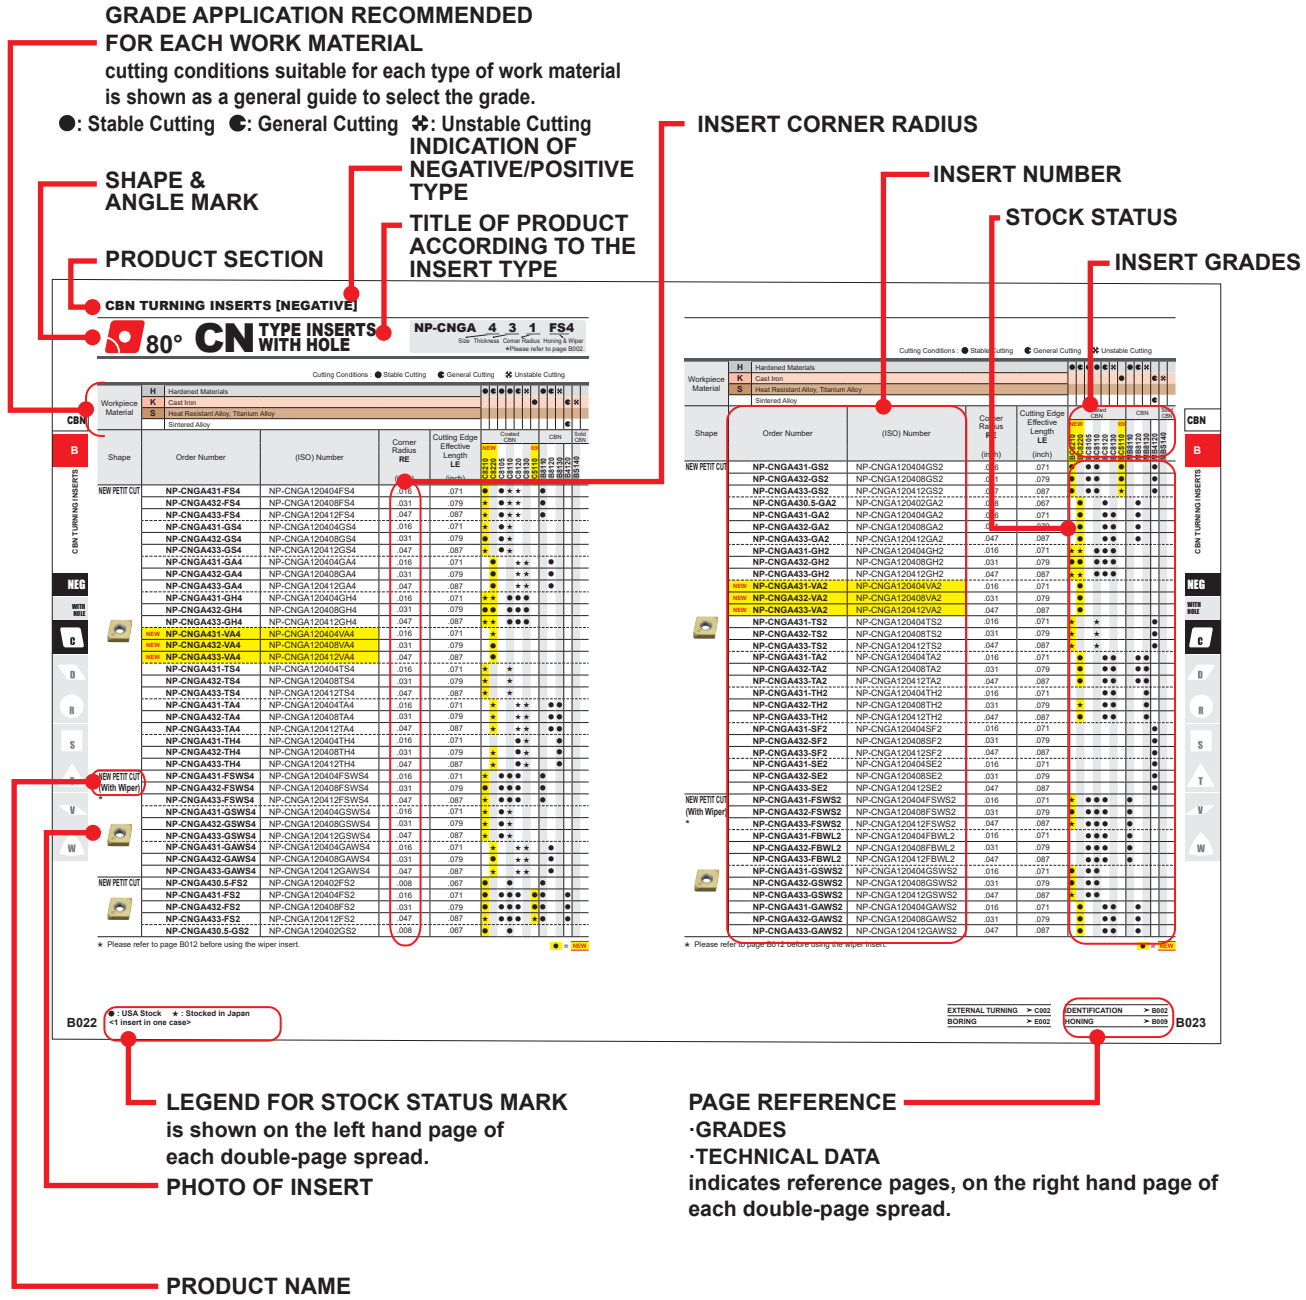
HOW TO READ THE STANDARD OF CBN & PCD TURNING INSERTS

●How this section page is organized

①Organized according to turning insert shape.
(Refer to the index on the next page.)

②Inserts are arranged in order of :

- Negative inserts (with hole→without hole)
- Positive inserts (with hole→without hole)



●To Order : Please specify insert number and grade.

CLASSIFICATION OF CBN & PCD GRADES

UNCOATED CBN MATERIALS

CBN sintered material based cutting tools are produced by binding CBN (cubic Boron Nitride) and ceramic. Its hardness is next to diamond and it is sintered under ultra-high pressure and high temperature.
CBN has a lower affinity to iron than diamond. The low affinity and high hardness properties mean that sintered CBN delivers a superior cutting performance especially during high-speed machining of materials such as hardened steel, cast iron and sintered alloys, etc.

COATED CBN MATERIALS

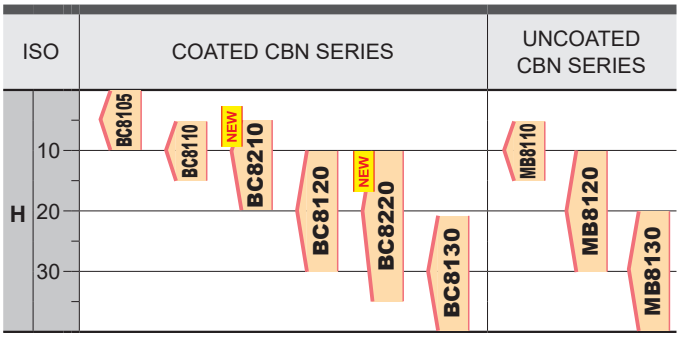
Mitsubishi Materials achieves longer tool life by using a unique "particle-activated sintering method" and combines it with an increased cutting edge strength. This specially developed PVD ceramic coating for CBN grades has a high crater wear resistance, longer tool life, and improved machine efficiency that exceed the conventional CBN grades.

PCD MATERIALS (Sintered Diamond)

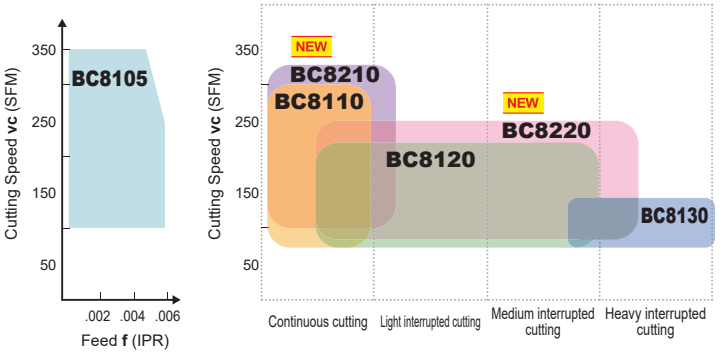
Suitable for cutting materials such as non ferrous metals and fiber reinforced plastics (FRP) including aluminum alloys.
It supports ultra-high-speed finish cutting.

Workpiece materials for turning grades/application area

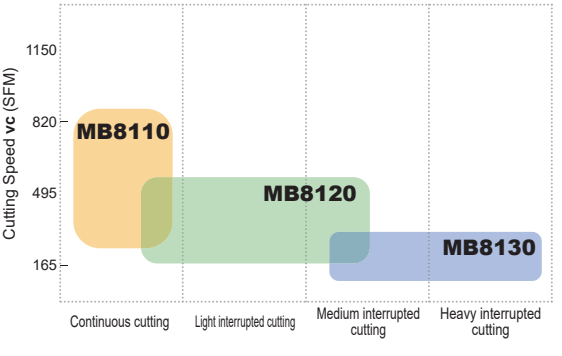
Hardened Steel



COATED CBN MATERIALS



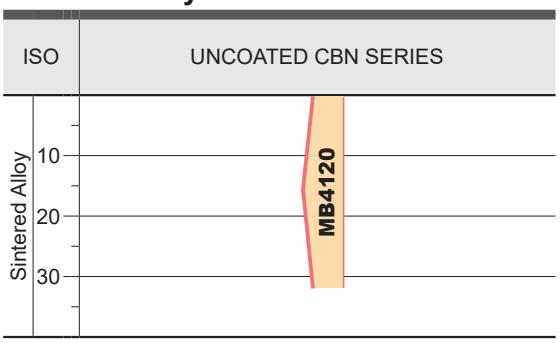
UNCOATED CBN MATERIALS

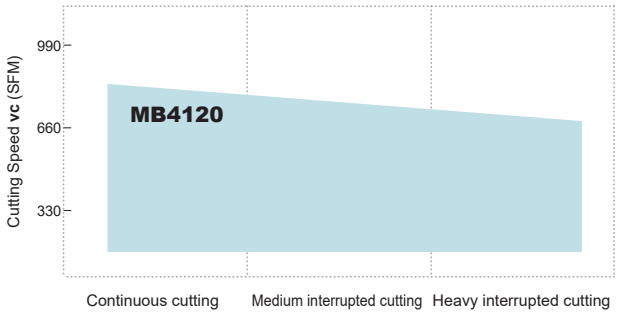


Suitable for finishing with surface roughness Ra .024 µinch or Rz .094 µinch or less.

Coated CBN Grades BC8200, BC8100 and Uncoated CBN Grade MB8100 for high hardness steel machining are available in a wide range of areas from finishing to continuous cutting of hardened steels and strongly interrupted machining.

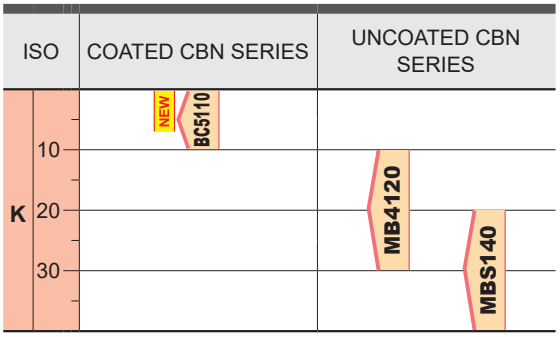
Sintered Alloys

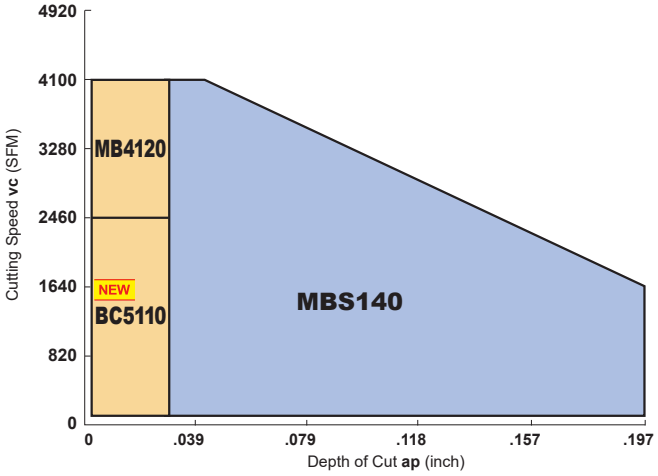




The CBN grade MB4120 for sintered alloys and cast iron cutting can be used widely from continuous cutting to interrupted cutting in the machining of cast iron and sintered alloys for valve mechanism parts and oil pump parts.

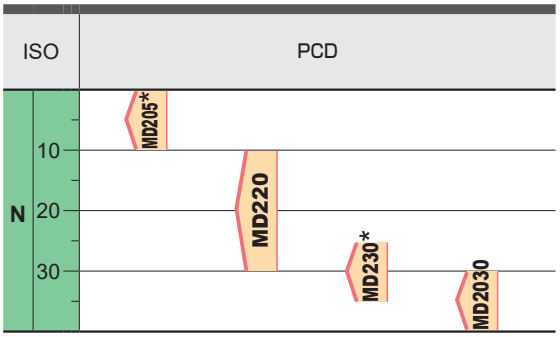
Cast Iron

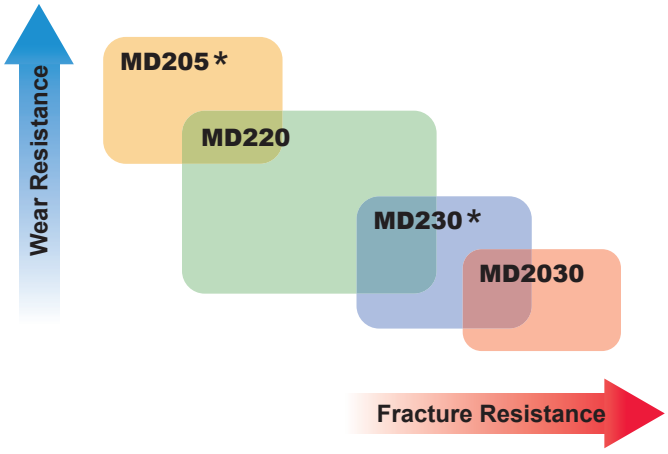




Lineup of grades available from general cutting to cutting of deep depths for high efficiency machining.

Aluminum Alloys





Suitable for cutting materials such as non ferrous metals and fiber reinforced plastics (FRP) including aluminum alloys.
It supports ultra-high-speed finish cutting.

*MD205 and MD230 are produced-to-order products.

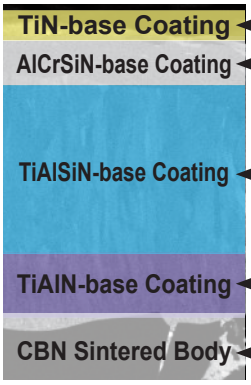
INTRODUCTION OF CBN GRADES

Coated CBN Grade for Machining of Hardened Steel

NEW BC8200 series

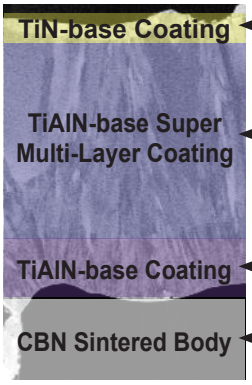
The new CBN substrate contains a new ultra micro-particle and heat resistant binder that suppress both chipping and crater wear which promotes longer tool life.

BC8210 NEW



- TiN-base Coating: Gold color assists easy identification of edge use.
- AlCrSiN-base Coating: Excellent chipping resistance. Absorbs impact forces.
- TiAlSiN-base Coating: Excellent wear resistance. Abrasion resistant layer.
- TiAlN-base Coating: Improved strength of adhesion to the CBN substrate prevents peeling. High adhesion layer for BC8210.
- CBN Sintered Body: Excellent crater wear and chipping resistance. Exclusive BC8210 sintered body.

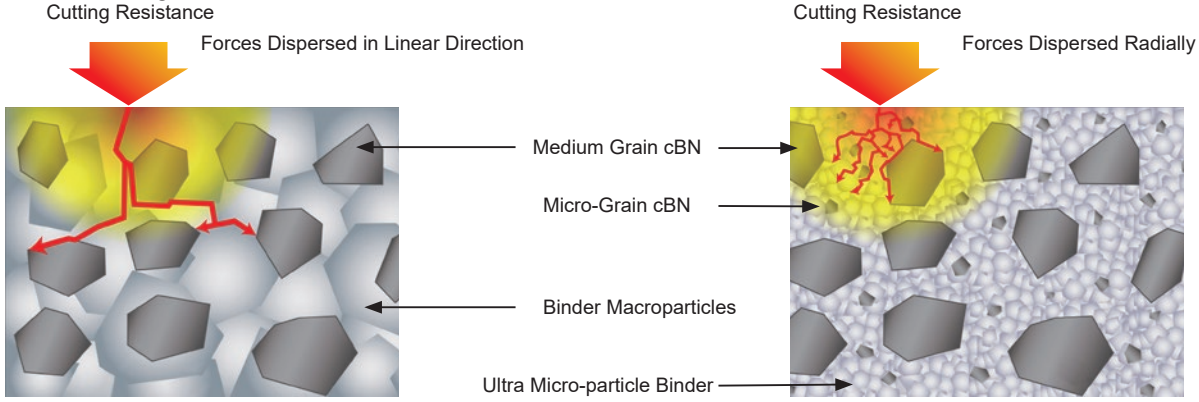
BC8220 NEW



- TiN-base Coating: Gold color assists easy identification of edge use.
- TiAlN-base Super Multi-Layer Coating: High wear and chipping resistance. Super Multi-Layer.
- TiAlN-base Coating: Improved strength of adhesion to the CBN substrate prevents peeling. High adhesion layer for BC8220.
- CBN Sintered Body: Excellent crater wear and fracture resistance. Exclusive BC8220 sintered body.

Ultra Micro-Particle Binder Prevents Sudden Defects

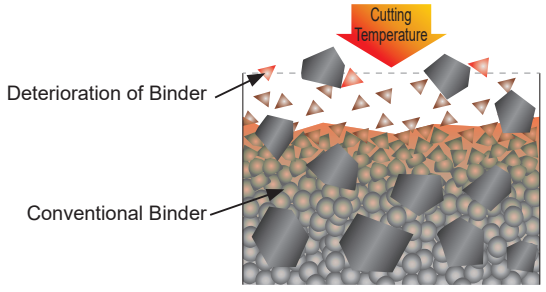
The ultra micro-particle binder cBN added to the CBN base material prevents linear crack development and avoids sudden fracturing.



Conventional **BC8200, BC8100 Series**

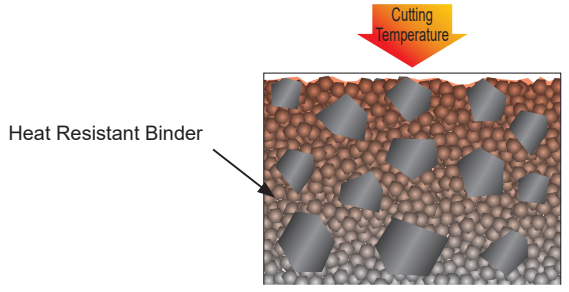
Heat Resistant Binder Suppresses Crater Wear

By increasing the heat reistance of the binder, wear resistance due to the deterioration of the binder component increases, thereby suppressing crater wear, chipping, and fracturing.



As binder wear progresses due to the heat produced during cutting, the cBN particles are exposed and lost.

Conventional



Suppresses the binder wear caused by cutting heat.

BC8200 Series

Coated CBN Grade for Machining Cast Iron

NEW BC5110

BC5110 uses a tough substrate with a remarkably hard coating to provide excellent chipping and wear resistance.

Excellent Chipping Resistance

Compared to conventional grades, the fine grain and high cBN content greatly improve chipping resistance and provide stability and long tool life.

Excellent Wear Resistance Coating

The hard ceramic coating layer provides excellent surface finishes as well as wear and notch resistance during continuous cutting.
Additionally, chipping and peeling of the coating layer is suppressed due to the improved bonding strength to the cBN substrate.

FOR CYLINDER LINER

MB5015 *Produced to order only.

MB5015 is an exclusive grade for boring of centrifugal casting cylinder liners in semi finishing or finishing applications with high wear resistance.

■ Recommended Cutting Conditions

Work Material		Cutting Mode	Cutting Speed vc (SFM) 330 1640 3280 4920	Feed f (IPR)	Depth of Cut ap (inch)	Cutting Mode

Work material : AISI No 30 B (Centrifugal casting) ϕ2.48"
Cutting Speed : vc=2625 SFM Feed : f=.014 IPR Depth of Cut : ap=.001 inch
Compornent : Centrifugal casting Cylinder liner Hole Depth : 3.94 inch

CBN

- Suitable for high speed finishing of heat treated steel, sintered ferrous alloy and cast iron.
- Low affinity to iron, thus good surface finishes are possible.
- Grinding can be replaced by machining.

●Heat Treated Steel

Work Material		Type	Cutting Mode	Recommended Grade	Recommended Cutting Conditions

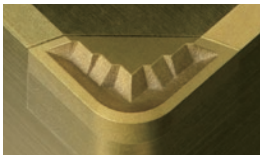
New Petit Cut Series

The surface area of the CBN sintered body has been optimized to allow for a lower price. Tool management is easier because repolishing is not required.

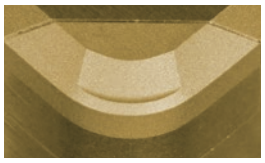
CBN BREAKER INSERT

■Application Area

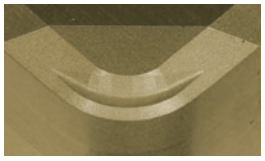
A BR breaker has been added to achieve better chip control at higher depths of cut.
A versatile range of chip breakers are available for a wide range of applications.



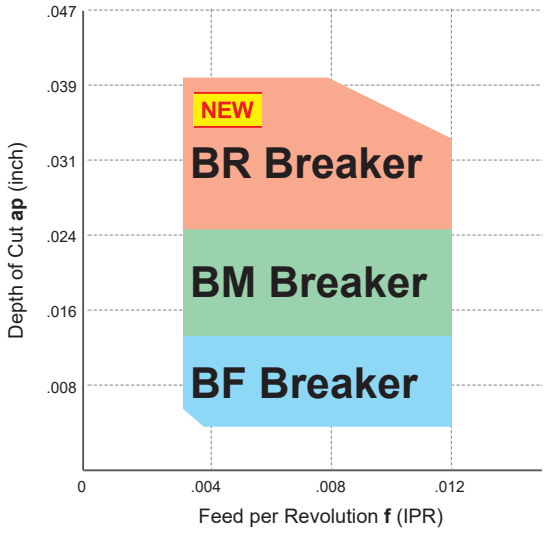
BR Breaker



BM Breaker



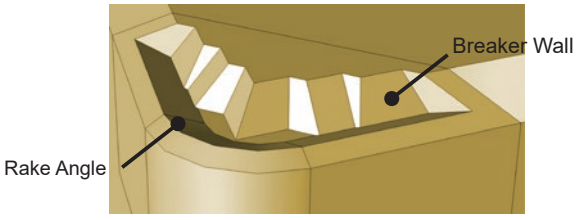
BF Breaker

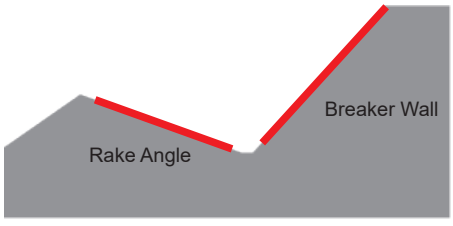


NEW BR Breaker (BC8220)

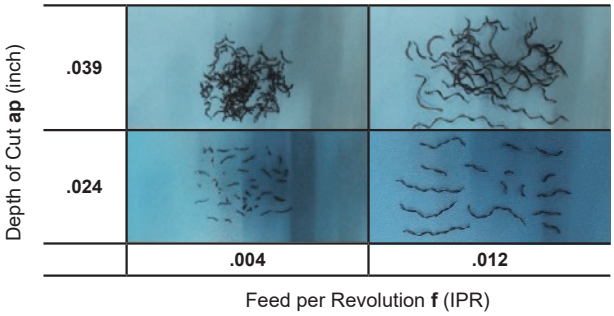
A reduced number of passes needed and improved chip control during high depth of cut.
Chips are formed with the effect from the rake angle, and the multi stage chip breaker wall supports a wide range of cuts.

Recommended Cutting Conditions : vc=260-655 SFM, f≤ .012 IPR, ap=.024-.039 inch





Achieves ideal chip control even at high depths of cut.

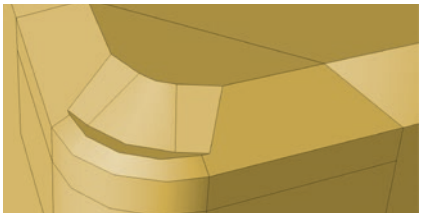


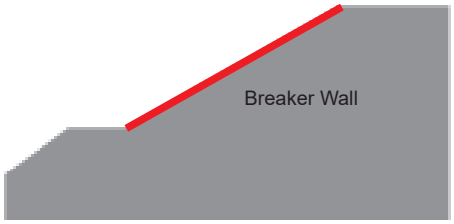
<Cutting Conditions>
Workpiece Material : AISI 5120H (60 HRC)
Insert : BR-CNGM432-TA2
Cutting Speed : vc= 655 SFM
Feed per Rev. : f= .004 IPR
.012 IPR
Depth of Cut : ap= .024 inch
.039 inch
Cutting Mode : Dry Cutting

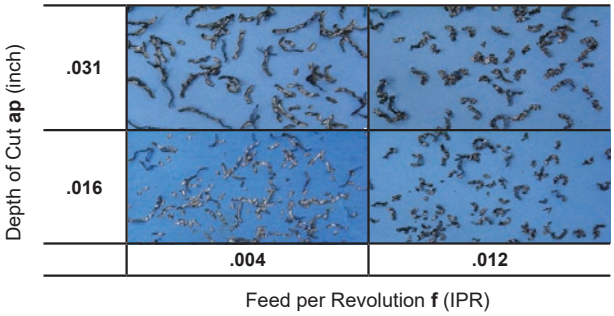
BM Breaker (BC8220)

Great chip control when machining at medium depths of cut. (.012-.031 inch)

Recommended Cutting Conditions : vc=260-655 SFM, f≤ .012 IPR, ap=.012-.031 inch





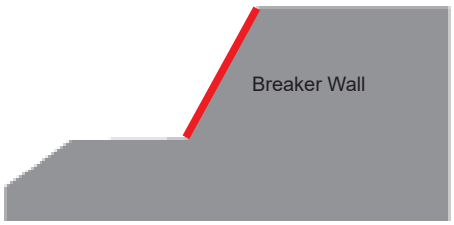


<Cutting Conditions>
Workpiece Material : JIS SCM415 (60 HRC)
Insert : BM-CNGM432-TA2
Cutting Speed : vc= 525 SFM
Feed per Rev. : f=.004 IPR
.012 IPR
Depth of Cut : ap=.016 inch
.031 inch
Cutting Mode : Dry Cutting

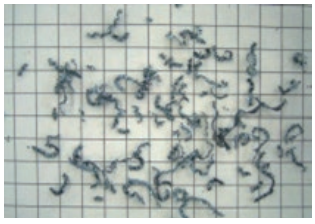
BF Breaker (BC8210, BC8220)

Achieves excellent chip control while finish cutting at depths of .012 inch or less.

Recommended Cutting Conditions : vc=260-655 SFM, f≤ .012 IPR, ap=.004-.012 inch

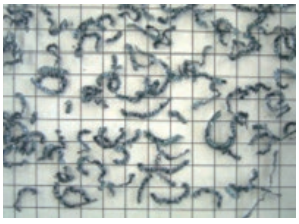


External Turning



Cutting Speed : vc = 330 SFM
Feed per Rev. : f=.008 IPR
Depth of Cut : ap = .012 inch

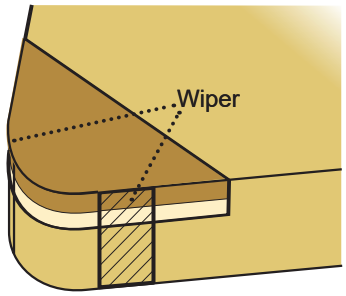
Boring



Cutting Speed : vc = 395 SFM
Feed per Rev. : f = .008 IPR
Depth of Cut : ap = .012 inch

<Cutting Conditions>
Workpiece Material : JIS SCM415 (60 HRC)
Insert : BF-CNGM432-TS2
Cutting Mode : Dry Cutting

WIPER INSERT



Improving Surface Finish

Under the same machining conditions as conventional breakers, but with the feed rate increased, the surface finish of the workpiece can be improved.

Improving Efficiency

High feed rates not only shorten machining times but also make it possible to combine roughing and finishing operations.

Increased Tool Life

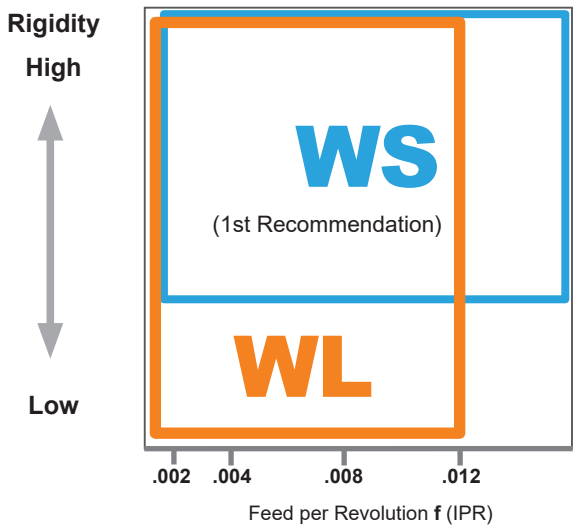
When changed to high feed conditions, the time required to cut one component is decreased, thus more parts can be machined with each insert. In addition, the high feed rate prevents rubbing, therefore, delaying the progression of wear and increasing the tool life of the insert.

Improving Chip Control

Under high feed conditions, the chips generated become thicker and are more easily broken, thus, chip control is improved.

■ Application of Wiper Inserts

The most recommended wiper shape is the WS Wiper. If deflection or chatter occur, use the WL Wiper.

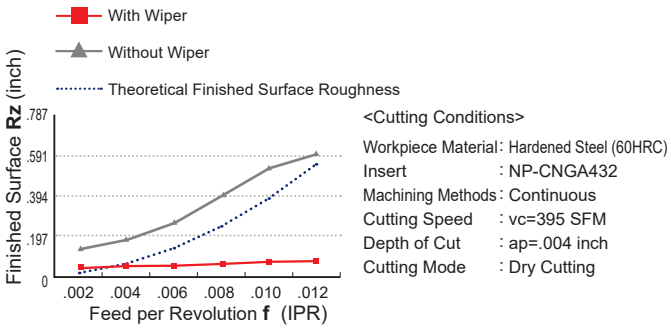


Examples of Low Rigidity:

- When overhang length is long due to boring
- When the workpiece material has a small diameter

■ Cutting Performance

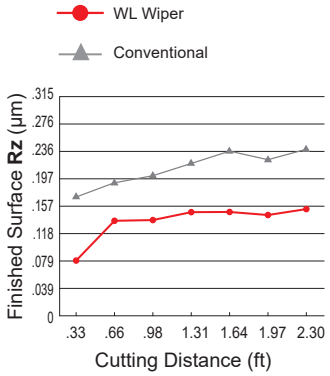
WL Wiper (External Turning)



<Cutting Conditions>

Workpiece Material	: Hardened Steel (60HRC)
Insert	: NP-CNGA432
Machining Methods	: Continuous
Cutting Speed	: vc=395 SFM
Depth of Cut	: ap=.004 inch
Cutting Mode	: Dry Cutting

WL Wiper (Boring)



<Cutting Conditions>

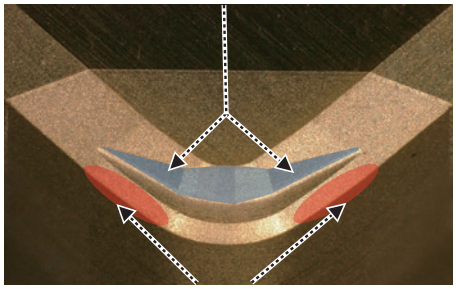
Workpiece Material	: AISI 5115 (60HRC)
Insert	: NP-CNGA432-FBWL2
Machining Methods	: Continuous
Cutting Speed	: vc=525 SFM
Feed	: f=.012 IPR
Depth of Cut	: ap=.004 inch
Cutting Mode	: Dry Cutting

Stable surface finish is maintained even in unstable cutting.

Combination of BF Breaker and WS Wiper Insert

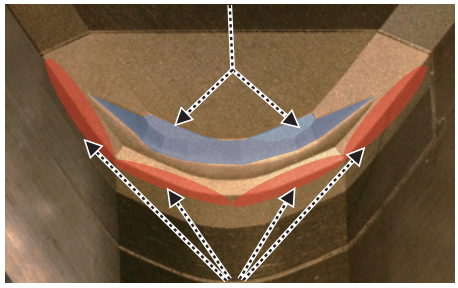
CNGM and DNGM types are now available with new inserts that combine a BF chip breaker with a WS wiper Insert.
(BC8210 : BF-○NGM○○○○○○TSWS2, BC8220 : BF-○NGM○○○○○○TAWS2)
It is effective for chip control and an improvement of finished surface roughness without worrying about the hand of the tool even when continuous external or internal turning and facing.

BF breaker



WL Wiper (No hand)
BF-CNGM120408TSWS2

BF breaker



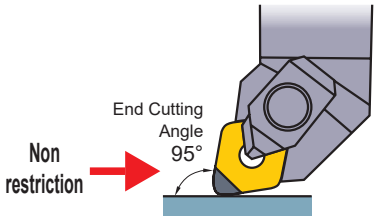
WL Wiper (No hand)
BF-DNGM150412TAWS2

■ Precautions when Using Wiper Inserts

When Using CNGM Type

No Restriction for Holders

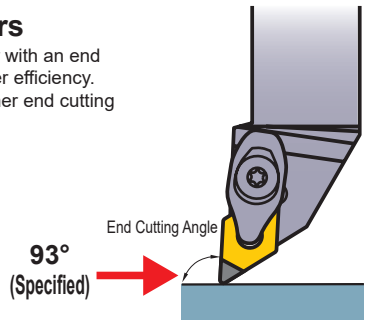
A standard holder can be used.
(*A double clamp, high rigidity tool is recommended.)



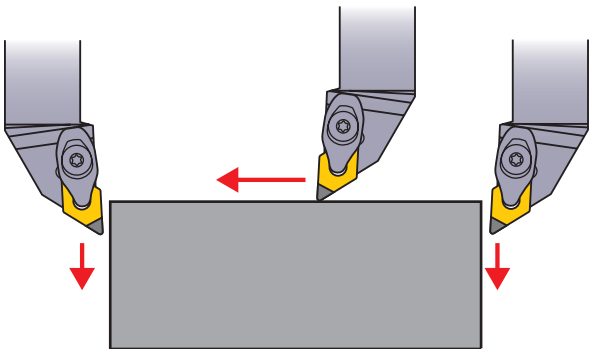
When Using DNGM Type

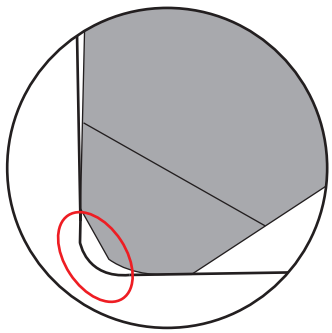
Restriction for Holders

Use a PDJN holder or DDJN holder with an end cutting angle of 93° to improve wiper efficiency.
There is no wiper efficiency with other end cutting angles (60°, 90°,107°, etc.).



Displays great wiper efficiency when machining the end face and outer diameter in both right-hand and left-hand machining.





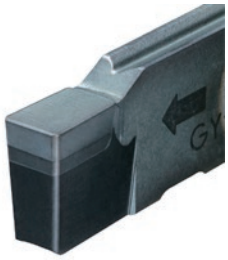
*The DNGM type is not suitable for machining the R that connects the end face and the outer diameter because it will leave uncut parts.

CBN GROOVING SERIES
(GY)

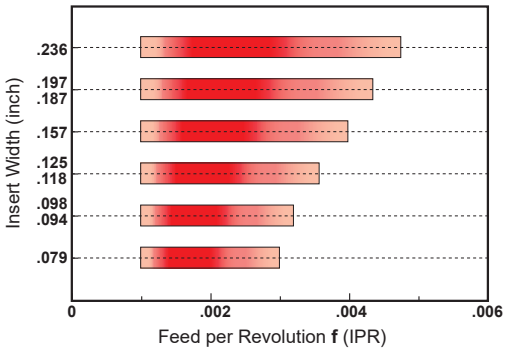
BC8110 coating for continuous machining of hardened steel has been added to GY inserts.

GY is a grooving tool series that achieves high rigidity with the "Tri-Lock System". (See page F004 for more details.)

BC8110 coating with excellent wear resistance has been added. Compared to conventional coating, it displays excellent wear resistance that achieves a longer tool life. A blade width of 6.0 has also been added to the BC8110 lineup.



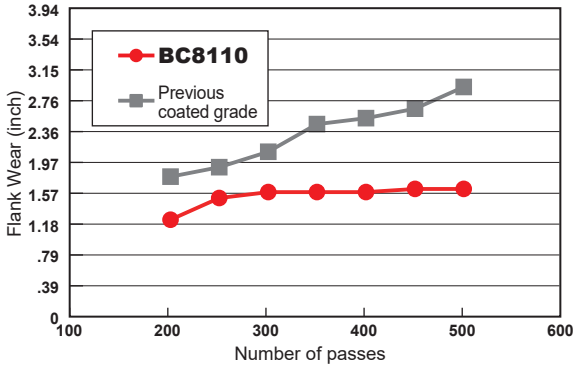
■ Recommended Cutting Conditions



Workpiece Material		Hardness	Grade	Cutting Speed vc (SFM)	Cutting Mode
H	Hardened Steel	35—65HRC	**BC8110**	330 (195—395)	Dry,Wet

■ Cutting Performance

Tool life evaluation for the GY holder



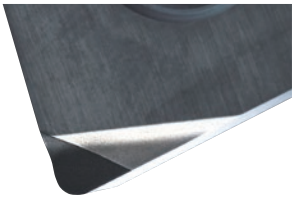
<Cutting Conditions>
Insert : GY1G0200D020N-GFGS
Workpiece Material : Hardened Steel (60HRC)
Cutting Speed : vc=395 SFM
Feed : f=.004 IPR
Depth of Cut : ap=.012 inch
Cutting Mode : Dry Cutting

■ Application Example

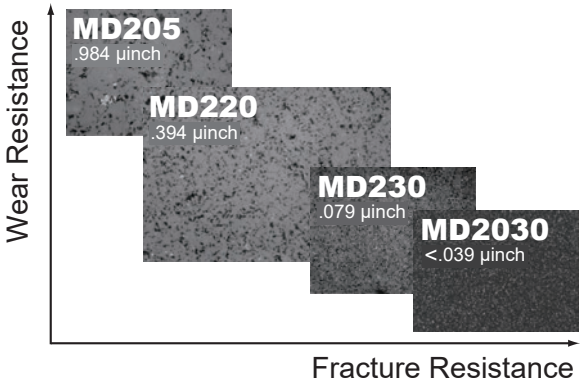
Insert	**GY1G0300F020N-GFGS** (Grade : **BC8110**)
Workpiece Material	 SNCM230H (58—62HRC)
Component	Input shaft
Cutting Conditions — Cutting Speed vc (SFM)	425
Cutting Conditions — Feed f (IPR)	.004
Result	 Tool life over twice as long as conventional products

INTRODUCTION OF PCD (SINTERED DIAMOND) GRADES

- Suitable for materials such as aluminum alloy, non ferrous metals, and fiber strengthened plastic.
- Suitable for extremely high speed finishing.



FEATURES



Grade	Features
MD205 *	**For Continuous Cutting** Coarse grain diamond particles are sintered and wear resistance is excellent. Use when wear resistance with MD220 is insufficient.
MD220	**Materials for General Machining** Sintered medium grain diamond particles. Wear resistance and fracture resistance are superbly balanced. Applicable to general finishing of non ferrous metals, non-metal cutting, and similar machining.
MD230 *	**For Interrupted Cutting** Fine grain diamond particles are used. Fracture resistance and cutting edge sharpness are excellent. Use when fracture and a high quality finished surface is demanded with MD220.
MD2030	**For Heavy Interrupted Cutting** Strong sintering of ultra micro-grain PCD particles provides exceptional fracture resistance. Chipping during high-speed finish turning can be controlled.

*MD205 and MD230 are produced-to-order products.

■ SELECTION STANDARD

TURNING

Work Material	Recommended Grade			Recommended Cutting Conditions

Note1) ◎ : 1st recommendation. ○ : 2nd recommendation
Note2) Not suitable for steel.

■ NEW PETIT CUT INSERT SERIES

- **Economical** Low cost is achieved by reducing the area of the diamond sintered body. In addition, tool management is economical because regrinding is unnecessary.
- **With Breaker** Chip breaker formed directly on the PCD portion delivers superior chip control.
- Corner R.002" inserts are available, making it suitable for the machining of small work corner radii.

Memo

HOW TO READ THE STANDARD OF EXTERNAL TURNING TOOLS

●How this section page is organized

①Organized according to turning insert shape.
(Refer to the index on the next page.)

TYPE OF TOOL HOLDER
indicates the first four letters of the order number, as well as cutting applications.

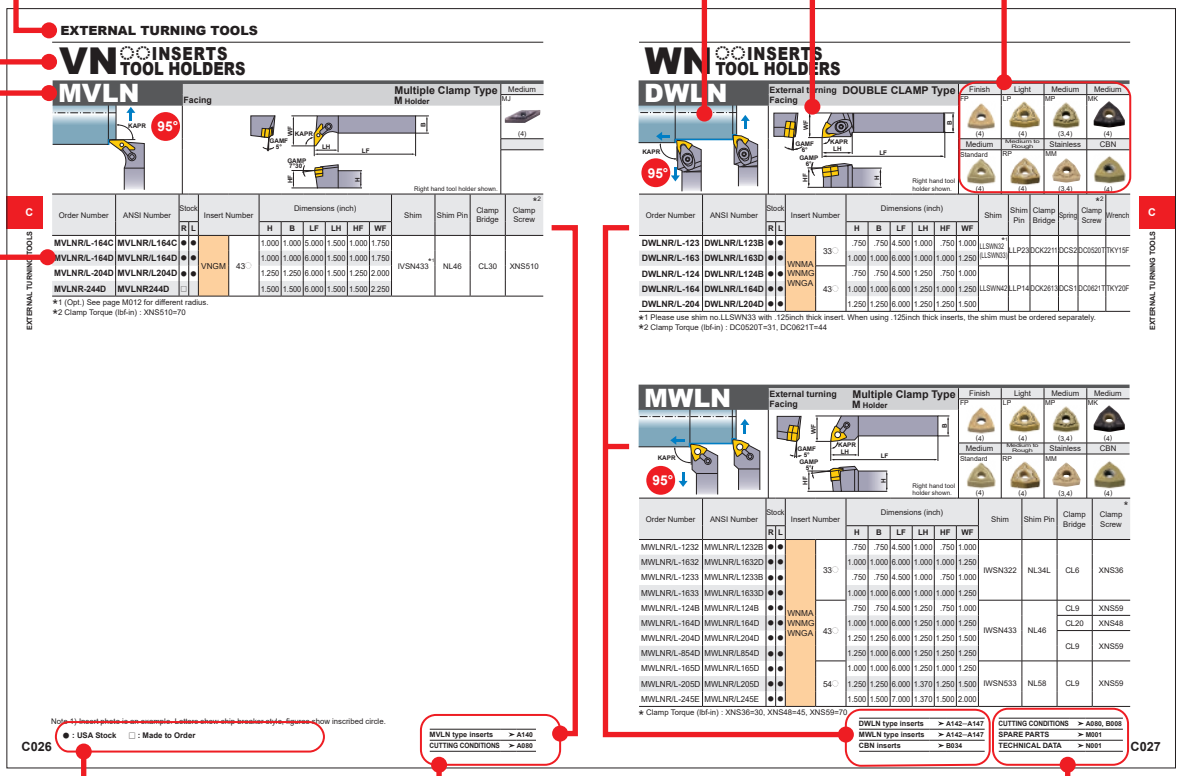
TITLE OF PRODUCT BY INSERT TYPE

PRODUCT SECTION

FIGURE SHOWING THE TOOLING APPLICATION
uses illustrations and arrows to depict the available machining applications such as external turning, copying, facing, and chamfering together with cutting edge lead angles.

GEOMETRY

CHIP BREAKER BY CUTTING APPLICATION



LEGEND FOR STOCK STATUS MARK
is shown on the left hand page of each double-page spread.

REFERENCE PAGE FOR APPLICABLE INSERTS
indicates reference pages giving details of inserts that are applicable to the product.

PAGE REFERENCE
·SPARE PARTS
·TECHNICAL DATA
indicates reference pages, including the above, on the right hand page of each double-page spread.

PRODUCT STANDARDS
indicates order numbers, stock status (per right/left hand), applicable inserts, dimensions, and spare parts.

●To Order : Please specify order number and hand of tool (right/left).

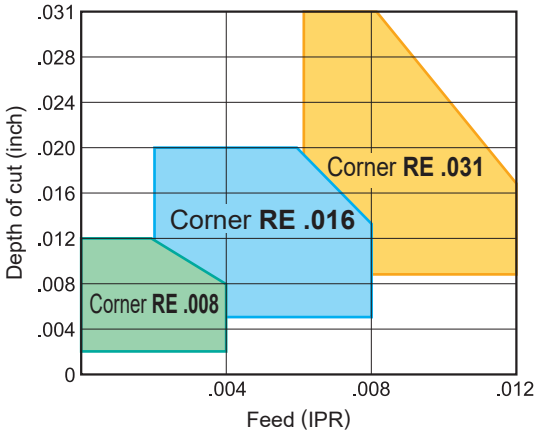
APPLICATION RANGE



RECOMMENDED CUTTING CONDITIONS

	Work Material	Hardness	Grade	Cutting Speed (SFM)
P	Mild Steel	≤180HB	**MC6125**	1115 (785—1310)
	Carbon Steel, Alloy Steel	**150HB—250HB**	**MC6125**	720 (525—920)
M	Stainless Steel	≤200HB	**VP15TF**	330 (230—395)

Note 1) The above cutting conditions are general guidelines. Adjustments maybe necessary depending on machine rigidity, work material geometry and clamping.

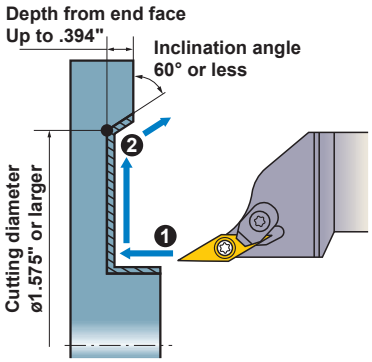
Note 1) Insert photo is an example. Letters show chip breaker style, figures show inscribed circle.

● : **USA Stock**

SXZC type inserts ➤ A199

OPERATIONAL GUIDANCE

Notes when end face profiling



Pay special attention to the following when face profiling.

Machining of an outer diameter (Step ①)

- To prevent burr formation, the depth of cut should be less than half the corner radius.

Machining of an inclination (Step ②)

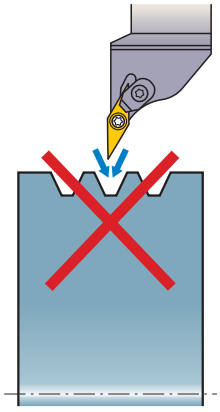
- To reduce the contact length of chips, the depth of cut should be less than half the corner radius.
- To prevent interference between the tool and the work material, the cutting diameter should be 1.575" or larger, inclination angle 60° or less and depth from the end face up to .394".

When changing inserts

- When indexing the inserts, it is recommended to preset the cutting edge position to maintain machining accuracy.

Not possible

Machining of V-pulleys



When machining V-pulleys, use a VNMG insert

HOW TO READ THE STANDARD OF SMALL TOOLS

●How this section page is organized

①Organized according to the cutting mode of small tools.
(Refer to the inside title on the next page.)
②Shown as Turning → External Grooving → External Cutting Off → Threading → Boring.

TYPE OF TOOL HOLDER
indicates the first four letters of the order number, as well as cutting applications.

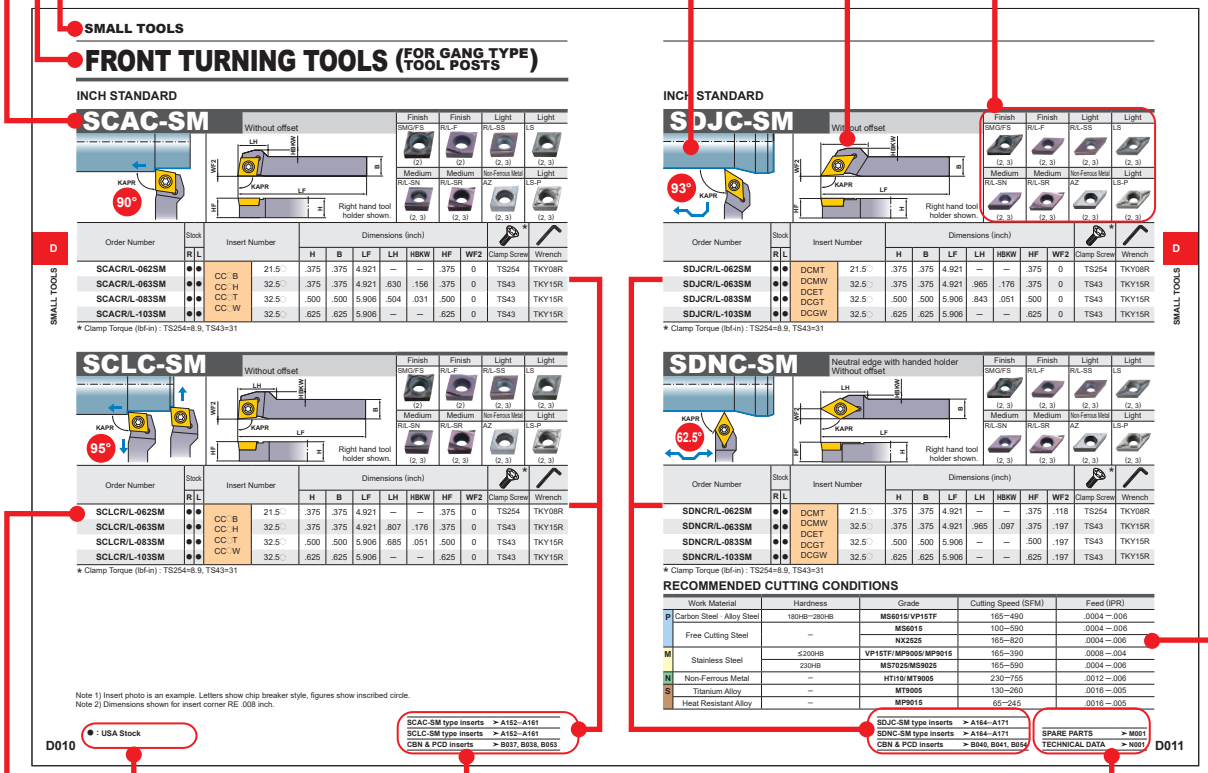
APPLICATION

PRODUCT SECTION

FIGURE SHOWING THE TOOLING APPLICATION
uses illustrations and arrows to depict the available machining applications such as external turning, copying, facing, chamfering, threading, and grooving together with cutting edge lead angles.

GEOMETRY

CHIP BREAKER BY CUTTING APPLICATION



LEGEND FOR STOCK STATUS MARK
is shown on the left hand page of each double-page spread.

REFERENCE PAGE FOR APPLICABLE INSERTS
indicates reference pages giving details of inserts that are applicable to the product.

PAGE REFERENCE
·SPARE PARTS
·TECHNICAL DATA
indicates reference pages, including the above, on the right hand page of each double-page spread.

PRODUCT STANDARDS
indicates order numbers, stock status (per right/left hand), applicable inserts, dimensions, and spare parts.

RECOMMENDED CUTTING CONDITIONS
for each work material classification, indicates recommended cutting conditions according to the ISO categories for cutting grades, P, M and N.

●To Order : Please specify order number and hand of tool (right/left).

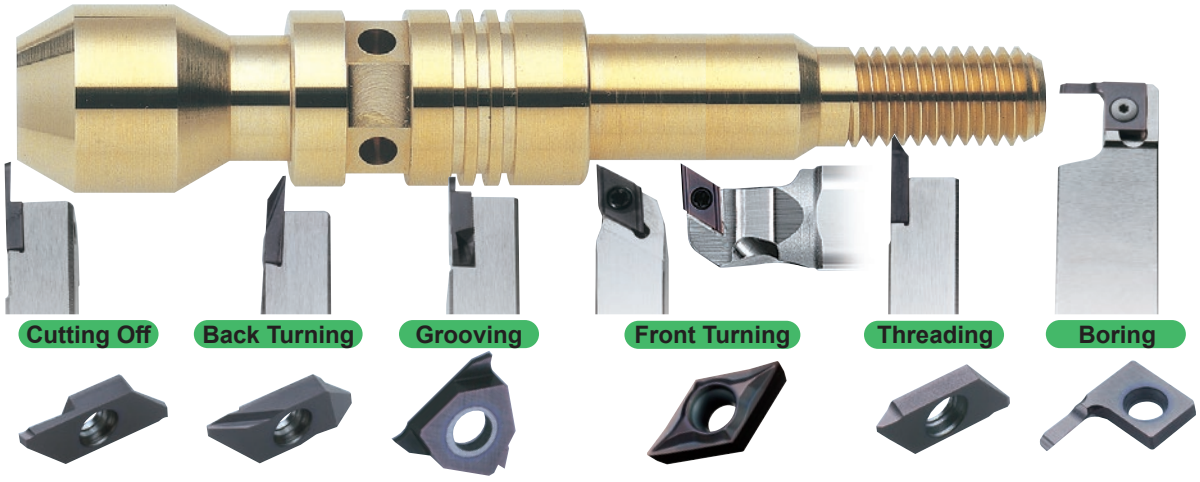
OUTLINE OF SMALL TOOLS

TOOLS FOR GANG TYPE AUTOMATIC LATHES (FOR EXTERNAL TURNING AND BORING)



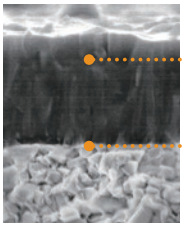
MS Series - PVD Coated Grades for High Precision and Small Parts Machining

MS6015

Skilled at pure iron, carbon steel and free cutting steel turning and achieving implemented stable finished surfaces and excellent dimensional accuracy.

	MS6015	Conventional
Coating	TiCN multilayer	TiAlN
Hardness (HV)	3,000	2,800
Wear Coefficient (Carbon Steel)	Low	High
Base Material Hardness (HRA)	92.0	92.0
T.R.S (GPa)	2.0	2.0

Ti-C-N Multilayer Coating



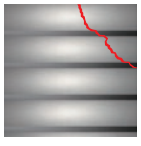
Superior wear and welding resistance and demonstrating the best possible results for carbon steel.

Minute multilayers remarkably improve welding.

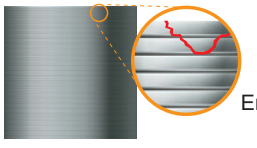
MS7025 NEW

Dramatically improved welding and wear resistance in low feed machining with a more precise nano-multilayer coating

By combining the high lubrication layer with excellent welding resistance, and the high hardness layer with a greater wear resistance that suppresses the progress of wear at the nano-level, the film damage is significantly reduced and the welding and wear resistance are dramatically improved.



Conventional Multilayer Coating



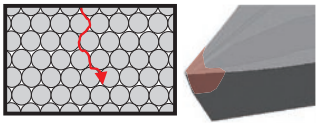
Nano-multilayer Coating

MS9025 NEW

Effective reduction of notch wear of stainless steel with a balance of wear and fracture resistance

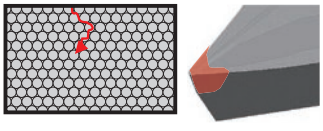
Thermal conductivity has been improved by optimizing the grain size and therefore reducing the boundary contact between the WC particles. This optimization reduces the temperature of the cutting edge during machining.

MS9025



Reducing the cutting edge temperature by improved thermal conductivity.

Conventional



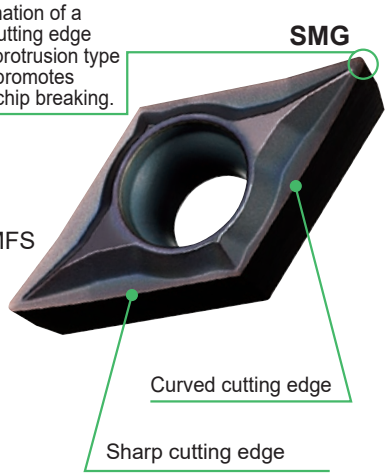
Higher cutting edge temperatures due to more particle boundary contact.

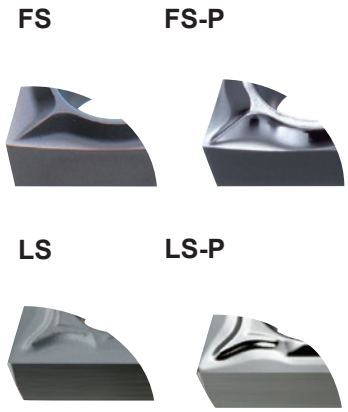
●Molded Breaker Insert

Nose radii designed with minus tolerance

- Suitable for small parts applications that often require minus tolerance dimensions.
- The order number is shown with the letter “M” that indicates minus tolerance. ex) DCGT32.50.2MFS
- The radius value is printed on the side of the insert label for easy recognition.

A combination of a curved cutting edge and the protrusion type breaker promotes efficient chip breaking.



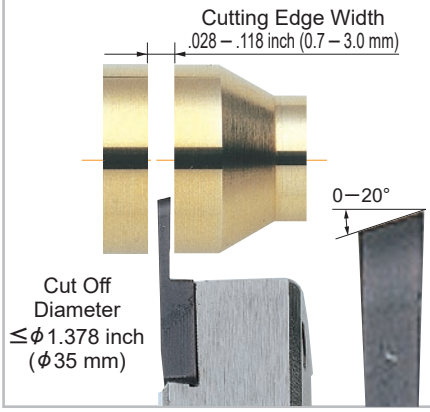


●Tolerance Corner R

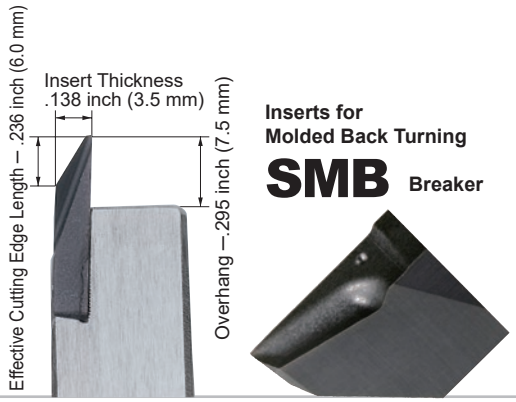
E class
RE $^{0}_{-.0008}$ inch

The letter “M” insert
RE $^{0}_{-.002}$ inch
(Conventional G-class insert
RE ± .004 inch)

●Cutting Off

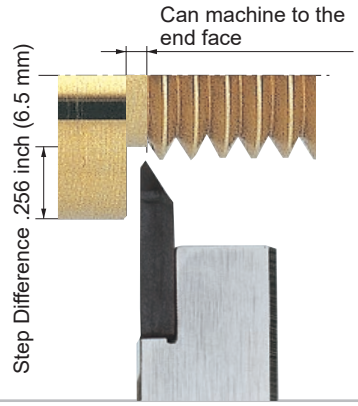


●Back Turning

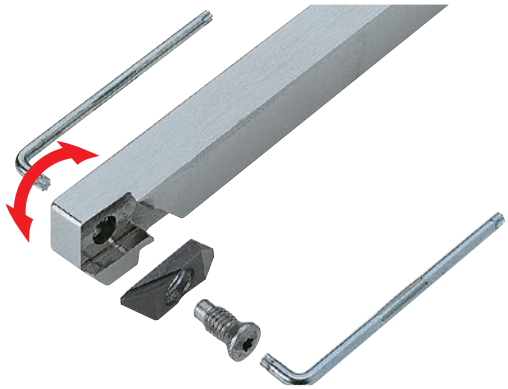


Inserts for Molded Back Turning
SMB Breaker

●Threading



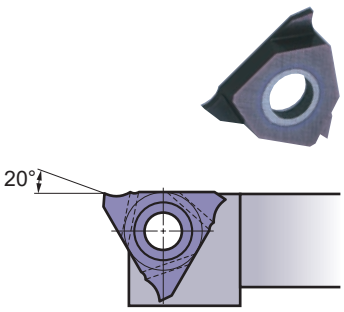
●Back Clamping Mechanism



Screw designed for front and back clamping.

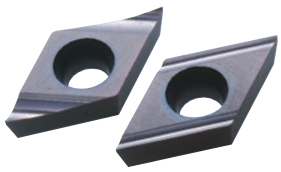
●Grooving

- 3-cornered
- Groove width .012– .118 inch (0.3-3.0 mm)
- Traversing possible



●Front Turning

- ISO E class accuracy inserts
- A wide variety of small corner R inserts
- Rake angle 30°



OUTLINE OF SMALL TOOLS

Grooving System

GY series

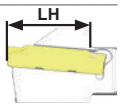
Max. Cut Off Diameter : 1.339 inch (34mm)

Monoblock Holder for Swiss-type Automatic Lathe

The new geometry with greatly improved rigidity suppresses vibrations and dimensional changes thereby solving problems during cut off.

Overhang Length Compatible with Swiss-type Automatic Lathes

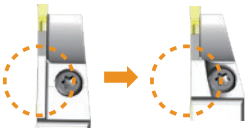
Head length corresponding to the maximum machining diameter of CNC Swiss-type automatic lathes and turret machines.



Features of High Rigidity Holder

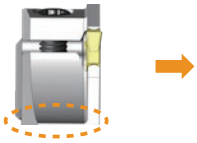
Strong Clamp Bridge

The strong design of the clamp bridge suppresses chatter and vibration.



Thicker Tool Base

Tool deflection caused by cutting resistance is greatly reduced.

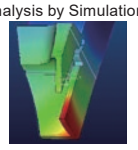


Analysis by Simulation

Deflection Measurement : .0017 inch (0.044 mm)

Analysis by Simulation

Deflection Measurement : .0005 inch (0.013 mm)



Analysis by Simulation

Tools for a very wide range of small parts machining

External Turning	Tools for front turning, back turning, grooving, threading, and cutting off
Internal Turning	Tools for boring, internal grooving and internal threading
Drilling	Drills
End Milling	End Mills

Tools for CNC automatic and small lathes

Types of Tool Posts	Gang type, turret type, cam type (radial pattern type)
Tool Sizes	Square shank: .375—.625 inch (8 — 16 mm) Round shank : less than ϕ1 inch (ϕ25.4 mm)

Indexable inserts developed under the concept of "high-quality, high efficiency and long tool life."

High-Quality	E class tolerance, sharp cutting edge, high accuracy small corner R, smooth surface finish
Long Tool Life	PVD coating MS6015 / MS7025 / MS9025 / VP15TF
High Efficiency	Regrinding not necessary due to the employment of indexable inserts. A wide variety of top cutting edge geometries

Cutting Off & Grooving System

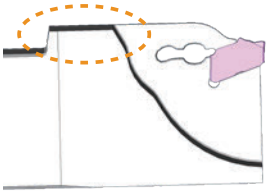
GW series

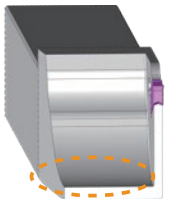
Monoblock Holder for Swiss-type Automatic Lathe

Max. Cut Off
2.992 inch (76mm)

High Rigidity Holder

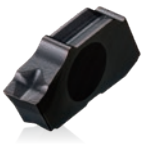
Tool deflection caused by cutting resistance and the remaining material pip in the center are greatly reduced.



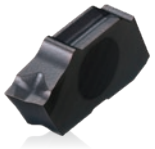


New Low Resistance and High Lead Angle Insert

New inserts with a lead angle of 8° have been added to the range to reduce burrs and the remaining material pip in the center.



Lead Angle 5°



Lead Angle 8°

TOOLS FOR CAM TYPE AUTOMATIC LATHES

- The most suitable for the use with cam type automatic lathes (radial pattern tool posts)
- The most suitable for machining of small parts with work diameter .197 inch (5mm) or smaller
- Single holder for front turning, back turning, grooving, threading and cutting off operations

*1 It is not possible to machine depths over **CDX** dimensions(Max. Groove Depth).
For the actual maximum depth that can be machined, check the **CDX** of only the insert.
*2 Clamp Torque (lbf-in) : NS404W=6.2

Note 1) Please use right hand insert for right hand holder and left hand insert for left hand holder.

Memo

HOW TO READ THE STANDARD OF BORING BARS

●How this section page is organized

①Organized by product series.
(Refer to the index on the next page.)

TYPE OF BORING BAR
indicates the initial letters for the order number, as well as applicable insert types.

TITLE OF PRODUCT SERIES

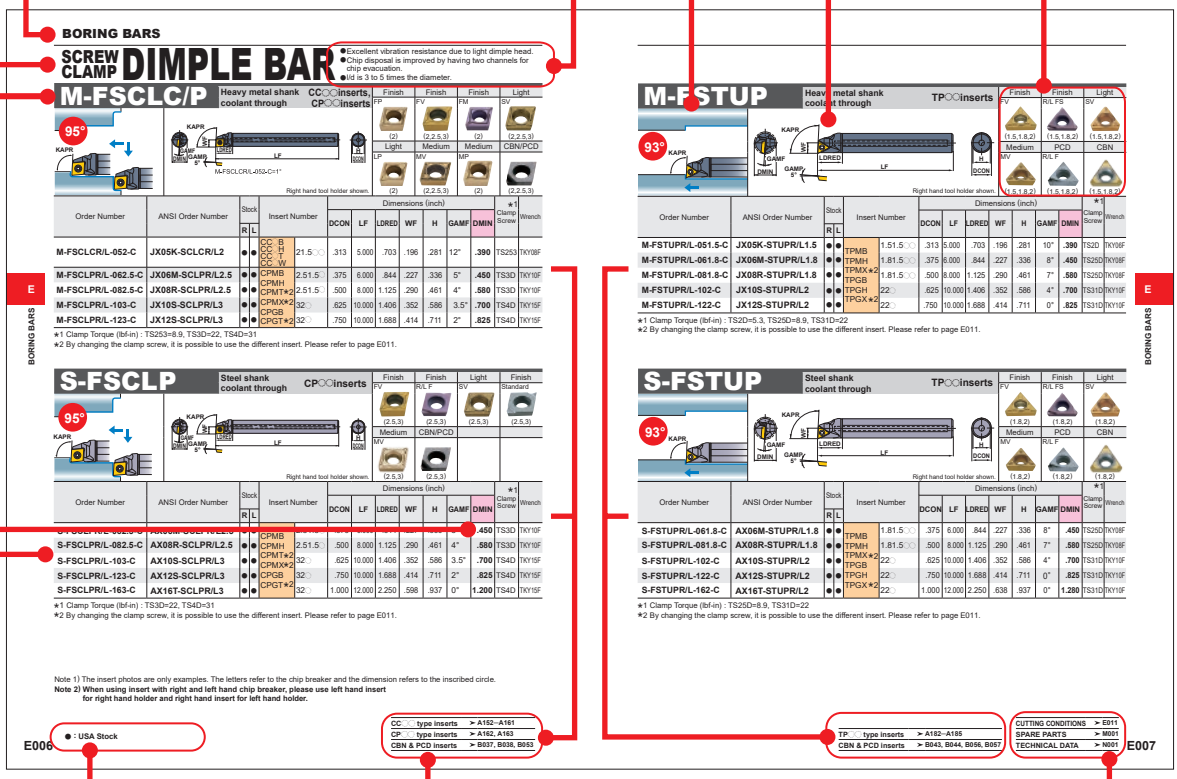
PRODUCT SECTION

PRODUCT FEATURES

FIGURE SHOWING THE TOOLING APPLICATION
uses illustrations and arrows to depict available machining applications along with cutting edge lead angles.

GEOMETRY

CHIP BREAKER BY CUTTING APPLICATION



LEGEND FOR STOCK STATUS MARK
is shown on the left hand page of each double-page spread.

PRODUCT STANDARDS
indicates order numbers, stock status (per right/left hand), applicable inserts, dimensions, minimum cutting diameters, standard corner radius, recommended l/d ratios, and spare parts.

MIN. CUTTING DIAMETER
is color-coded to let you find, at a glance, the maximum / minimum cutting diameters for internal machining.

REFERENCE PAGE FOR APPLICABLE INSERTS
indicates reference pages for details of inserts that are applicable to the title product.

PAGE REFERENCE
·SPARE PARTS
·TECHNICAL DATA
indicates reference pages, including the above, on the right hand page of each double-page spread.

●To Order : Please specify order number and hand of tool (right/left).

CLASSIFICATION

Type of Tool	Features	KAPR= 75°	KAPR= 90°, 91°	KAPR= 93°			
		KAPR	KAPR	KAPR			
SCREW CLAMP DIMPLE BAR	● The minimum cutting diameter is ϕ.390 inch. ● 5°, 11° positive insert. ● Excellent vibration resistance due to light dimple head. ● Chip disposal is improved by having two channels for chip evacuation. ● l/d is 3 to 5 times the diameter.			 **M-FSTUP, S-FSTUP** ➲E007	 **M-FSDUC** ➲E008	 **M-FSVUB/C** ➲E009	 **M-FSWUB/P** ➲E009
S Type Boring Bars	● Two wall pocket. ● 7º positive insert, low cutting force. ● Screw-on type.	**S-SSKC** ➲E015		 **S-SDUC** ➲E014	 **S-STUC, C-STUC** ➲E015, E016	**S-SVUC** ➲E017	 **S-SWUC** ➲E019
DOUBLE CLAMP DIMPLE BAR	● Negative rake. ● New double clamp type. ● Holds inserts securely. ● Excellent cutting edge repeatability.	**S-DSKN** ➲E022	**S-DTFN** ➲E022	**S-DDUN** ➲E021	**S-DVUN** ➲E023		
M Type Boring Bars	● Negative rake. ● Two wall pocket. ● Pin lock and top clamp retention. ● (Opt.) Single clamp available as clamp on or pin lock holder.	**S-MSKN** ➲E025	 **S-MTFN** ➲E025	**S-MDUN** ➲E024	 **S-MVUN** ➲E026		
AL Type Boring Bars	● Shank sizes ϕ.625 inch thru ϕ1.000 inch. ● Screw-on type. ● Recommended for aluminum, nonferrous metals and plastics.		**S-STFE** ➲E028				
MICRO-DEX Boring Bars (Carbide Shank)	● The minimum cutting diameter is ϕ5 mm (.197 inch). ● 7°positive insert. ● Carbide shank type. ● Easy-to-use tool geometries. ● Suitable for small workpiece. ● l/d is 5 times the diameter.			 **SWUB** ➲E029	 **STUC** ➲E030		
MICRO-MINI TWIN Boring Bars	● The minimum cutting diameter is ϕ2.2 mm (.087 inch). ● Solid carbide type with two cutting edges. ● Continuous cutting from boring to facing. ● With or without a chip breaker.						
MICRO-MINI Boring Bars	● The minimum cutting diameter is ϕ3.2 mm (.126 inch). ● Solid carbide type (Single cutting edges). ● l/d is 5 times the diameter. ● Cutting edge can be shaped according to the application. Thus, it covers a wide cutting range (threading,grooving,copying, etc.).	**C○○F/HR-BLS** ➲E031					
Coolant Through Carbide Boring Bars	● Two wall pocket. ● 7° and 11° positive insert, low cutting force. ● Screw-on type. ● Carbide shanks are stocked in various diameters.			**E-SDUC** ➲E043	 **E-STUC** ➲E044	 **E-STUP** ➲E045	 **E-SVUC** ➲E046
RBH Type Holder	● Holder for MICRO-MINI TWIN and MICRO-MINI. ● Round shanks suitable for use with frontal gang type tool posts with sleeve.	**RBH** Inch➲E034, Metric➲E036					
SBH Type Holder	● Holder for MICRO-MINI TWIN and MICRO-MINI. ● Square shanks suitable for use with frontal gang type tool posts.	**SBH** ➲E037					

Note 1) **S** : Steel shank, **M** : Heavy metal shank, **C** : Carbide shank. (For Micro-dex boring bars, carbide shank only.)

GRINDING THE CUTTING EDGE OF MICRO-MINI BORING BAR

●MICRO-MINI boring bar can be applied to boring and grooving without any modifications. It can also be reground as shown below.
●For shaping and regrinding, use diamond wet stone approximately #250 - #400. Please grind according to application using the figure below as a reference.

NOTES

Profile turning, Inner end facing	Copying
The cutting edge should not cross the center line of the workpiece. 	**The depth of cut should be smaller than the corner radius value.** If the cutting edge crosses the center line of a workpiece, the cutting edge can fracture.	With depths of cut larger than the corner radius value, burrs will be formed.

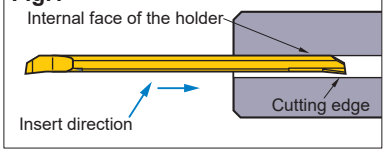
PRECAUTION IN USING THE MICRO-MINI TWIN

■PRECAUTIONS IN USING THE MICRO-MINI TWIN

●When using a holder for general purpose/small automatic lathe

1 To avoid chipping of the 2nd cutting edge take care when inserting the boring bar into the holder. Refer to fig.1 if the 2nd edge contacts the internal face of the holder there is a possibility that it may chip.

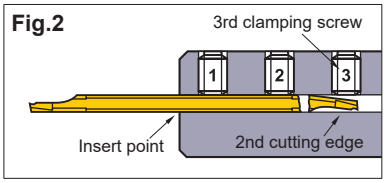
Fig.1



2 When clamping the boring bar into the holder, there is a possibility that damage to the shank and the 2nd cutting edge can occur. Make sure that the clamping screws are tightened to the set torque value. Additionally make sure that there is no clamping screw near the 2nd cutting edge as this can break the boring bar.

◎When using Mitsubishi holders with a tool overhang of 5 lxd, ensure that the 3rd clamping screw is removed prior to machining. (For RBH1620N, RBH19020N there are no 3rd clamping screws). The set torque value for clamping screw is 18 lbf-in. (2.0 N • m)

Fig.2



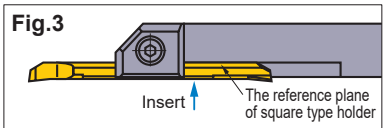
●When using a square type holder

1 When installing the boring bar into the holder, tighten the clamping screw making the micro-mini twin boring bars in contact with the reference plane of square type holder.

2 Make sure that the clamp screw is tightened. The recommended set torque value is shown in the table of holder.

3 Don't tighten the clamp screw without a micro-mini twin boring bar, otherwise the clamp bridge can be deformed.

Fig.3



Tighten the clamping screw ensuring making the micro-mini twin boring bars in contact with the reference plane of square type holder.

COOLANT THROUGH CARBIDE

- Two wall pocket.
- 7° and 11° positive insert, low cutting force.
- Screw-on type.
- Carbide shanks are stocked in various diameters.

HOW TO READ THE STANDARD OF GROOVING AND CUTTING OFF

●How this section page is organized

①Classified according to external or internal applications.
②Sub-classified according to product series.
(Refer to the index on the next page.)

[For External Grooving / Cutting Off] [For Internal Grooving]

FIGURE SHOWING THE TOOLING APPLICATION
uses illustrations and arrows to depict available machining applications such as cutting off, grooving, and copying.

INDICATION OF HOLDER TYPE ACCORDING TO APPLICATION
indicates the holder types, such as the standard type or the L type, according to machining application.

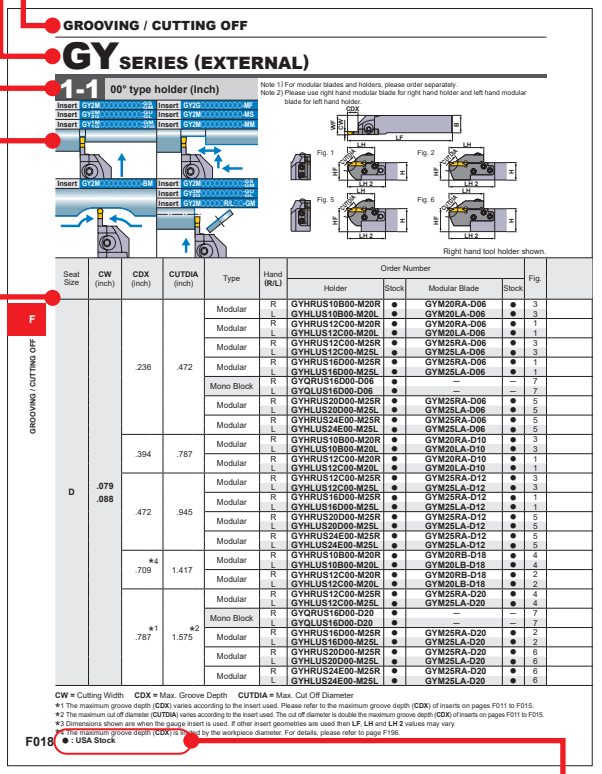
TITLE OF PRODUCT

PRODUCT SECTION

PRODUCT FEATURES

MIN. CUTTING DIAMETER
is color-coded to let you find, at a glance, the minimum cutting diameters for internal machining.

GEOMETRY



GROOVING / CUTTING OFF

GY SERIES (EXTERNAL)

1-1 00° type holder (Inch)

Note 1) For modular blades and holders, please order separately.
Note 2) Please use right hand modular blade for right hand holder and left hand modular blade for left hand holder.

Right hand tool holder shown.

CW = Cutting Width CDX = Max. Groove Depth CUTDIA = Max. Cut Off Diameter

*1 The maximum groove depth (CDX) varies according to the insert used. Please refer to the maximum groove depth (CDX) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (CUTDIA) varies according to the insert used. The cut off diameter is double the maximum groove depth (CDX) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then LF, LH and LH 2 values may vary.
*4 The maximum groove depth (CDX) is limited by the workpiece diameter. For details, please refer to page F196.

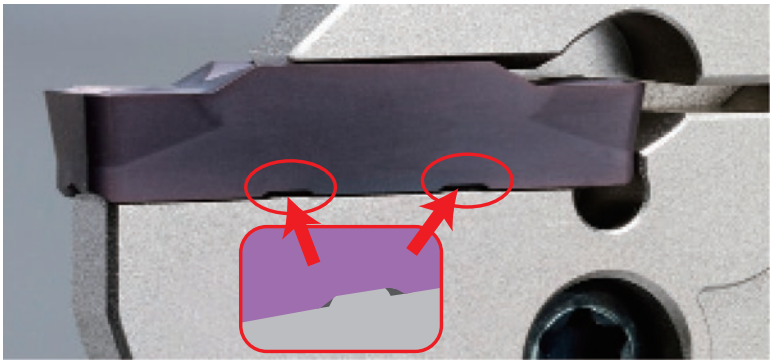
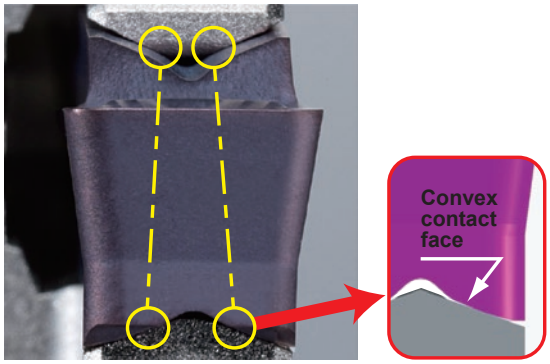
Original insert design leading the way to new grooving and cutting off applications

Highly reliable insert clamping

Safety keys prevent insert movement.



The convex geometry ensures high precision clamping.



New TRI-LOCK System for increased stability and performance!

TRI-LOCK System

The TRI-LOCK system ensures the blade is securely fixed in 3 directions (side, front and top), giving high rigidity for stable grooving and cutting off performance.

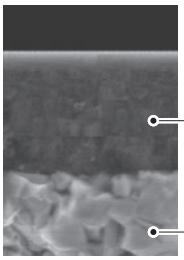
Stable ↑ Machining Condition ↓ Unstable	NX2525 MY5015 VP10RT VP20RT	VP10RT VP20RT	MY5015 VP10RT VP20RT	RT9010	NEW MP9015 / RT9010 NEW MP9025	BC8110

MP9000 Series

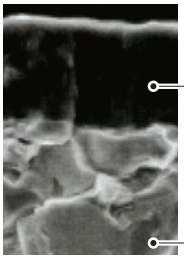


- The high Al-rich (Al, Ti)N single layer coating provides stabilization of the high hardness phase and succeeds in dramatically improving wear, crater and welding resistance.

High Al-rich (Al, Ti)N Single Layer Coating

Special Cemented Carbide Substrate

VP20RT (1st Recommendation)

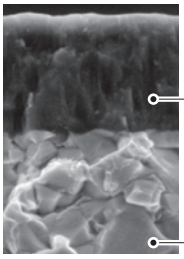


- PVD coated grade suitable for a wide range of applications. The combination of a special tough cemented carbide substrate with MIRACLE coating provides an excellent balance of wear and fracture resistance.

MIRACLE Coating

Carbide substrate (90.5HRA)

VP10RT



- PVD coated grade with a cemented carbide substrate harder than VP20RT. For use on difficult to cut materials and for extending tool life.

MIRACLE Coating

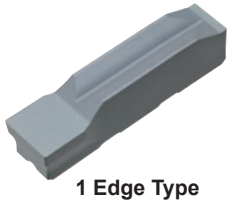
Carbide substrate (92.0HRA)

BLANK INSERTS

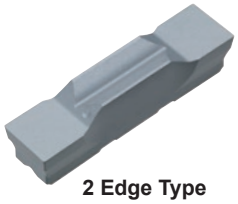
- Blank inserts for custom grinding

RT9010/RT9020 for blank insert

- First recommendation for blank inserts is RT9020 due to the tougher carbide substrate that is suitable for a wider range of applications.
  RT9010 has a harder substrate than RT9020 and is ideal for longer tool life on stable cutting applications.
  Both grades are recommended to have a coating applied that is suitable for the required application.



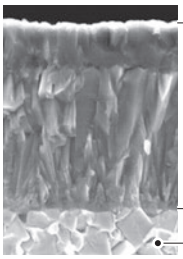
1 Edge Type



2 Edge Type

* Insert blank is not suitable for machining without grinding.

MY5015



- MY5015 is a CVD coated grade with excellent wear resistance even at high temperatures. It provides longer tool life when machining cast and ductile cast iron. Also suitable for high speed continuous cutting of steels.

CVD Coated Carbide

Carbide substrate

RT9010

- RT9010 is an uncoated cemented carbide grade. Suitable for processing non-ferrous metals.

NX2525

- NX2525, a cermet grade for finish machining of steels and for good surface finishes at lower cutting speeds.

BC8110

- A CBN coated grade for continuous cutting, which provides longer life when machining hardened steel.

GL Breaker for Aluminum Alloys

G Class Breaker

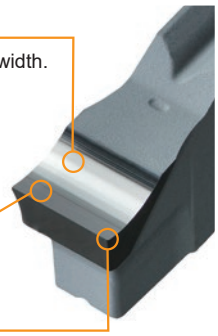
Improved chip control by narrowing the breaker width.

High Rake Angle

Achieves low cutting resistance.

Sharp Edge

Improved welding resistance for aluminium alloys.



MF Breaker (Finishing)

Efficient chip breaking when cross-feed machining.

Chips are controlled when finish machining.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F199.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F196.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F196.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH**, **LH 2** and **WF** values may vary.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH**, **LH 2** and **WF** values may vary.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F199.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

✶1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
✶2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
✶3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
✶4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F196.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

✶1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
✶2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
✶3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH**, **LH 2** and **WF** values may vary.

CW = Cutting Width **CDX =** Max. Groove Depth **DMIN =** Minimum cutting diameter

*1 The maximum groove depth (**CDX**) varies according to the cutting diameter (**DMIN**). For details, please refer to page F212.
*2 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF, LDRED, WF** and **WF2** values may vary.
*3 The maximum groove depth (**CDX**) is a value within the dimension (**LDRED**).

CW = Cutting Width **CDX =** Max. Groove Depth **DMIN =** Minimum cutting diameter

*1 The maximum groove depth (**CDX**) varies according to the cutting diameter (**DMIN**). For details, please refer to page F212.
*2 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF, LDRED, WF** and **WF2** values may vary.
*3 The maximum groove depth (**CDX**) is a value within the dimension (**LDRED**).

CW = Cutting Width **CDX =** Max. Groove Depth **DMIN =** Minimum cutting diameter

*1 The maximum groove depth (**CDX**) varies according to the cutting diameter (**DMIN**). For details, please refer to page F212.
*2 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF, LDRED, WF** and **WF2** values may vary.
*3 The maximum groove depth (**CDX**) is a value within the dimension (**LDRED**).

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F196.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F196.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F196.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F196.

DMIN = Min. Cut Diameter

*Modular blade type: Blades for face machining indicate a code for the minimum face grooving diameter. Example) GYM25RD-D12-040
The "◌" symbol is a position to insert the letter "A" for external diameter machining or "D" for face machining.

Note 1) The indicated dimensions are values for standard inserts (BM breakers). If other inserts are mounted, LF and LH may differ. Select the inserts and recommended conditions from "TOOL NEWS B255A-G GYGW Inserts".

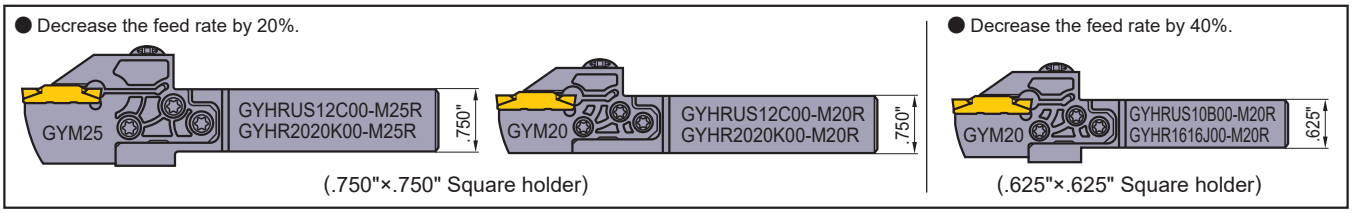
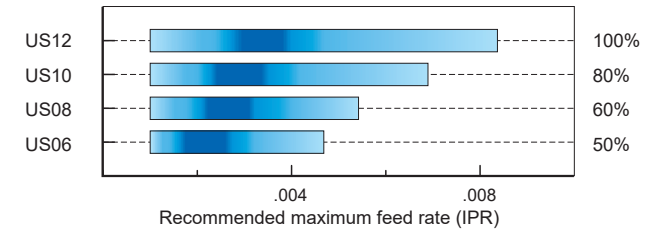
K	.315", 8.00 mm

Note 1) When using a combination as shown below, decrease the recommended feed rate by 20% and 40% respectively.



■ For Swiss-type lathes mono block holder

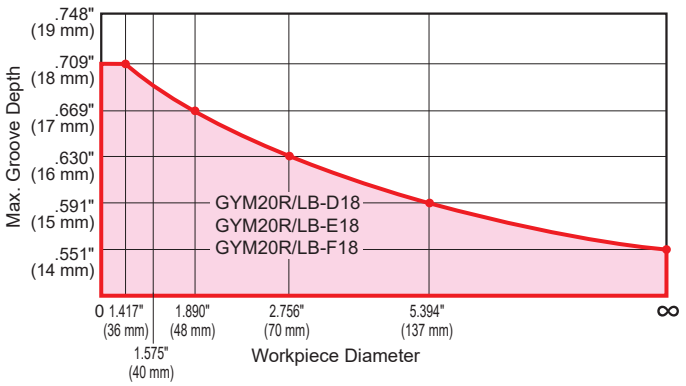


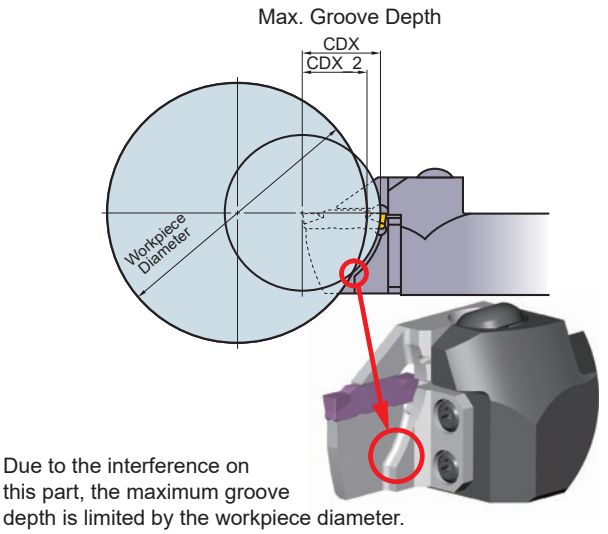
Please refer to the tables of recommended cutting conditions for external grooving.
Apply the percentage ratio shown of each shank size to the values in those tables.

LIMITATION OF THE MAXIMUM GROOVE DEPTH [For External Grooving]

•When using the modular blade GYM○○R/LA-○○○
The maximum groove depth is not limited by the workpiece diameter.

•When using the modular blade GYM○○R/LB-○○○
The maximum groove depth is limited by the workpiece diameter.



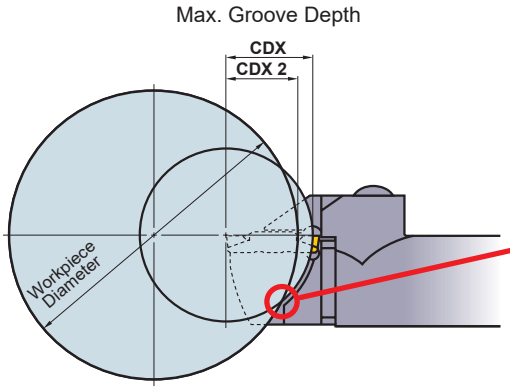


Due to the interference on this part, the maximum groove depth is limited by the workpiece diameter.

LIMITATION OF THE MAXIMUM GROOVE DEPTH [For External Grooving]

•In The Case of Mono Block Type Holder for Swiss-Type Lathes

The maximum groove depth is limited by the workpiece diameter.



Due to the interference on this part, the maximum groove depth is limited by the workpiece diameter.

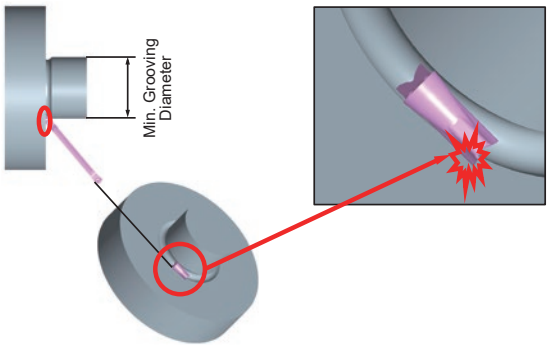
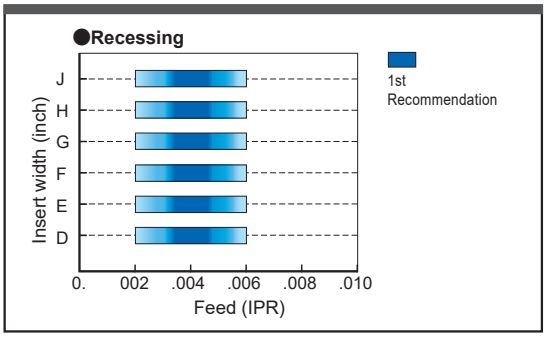
BM BREAKER

Minimum grooving diameter

Ensure the tool is suitable for the diameter being machined. Refer to the Min. Grooving Diameter as shown in the table on the first page to avoid a collision with the workpiece as shown below.

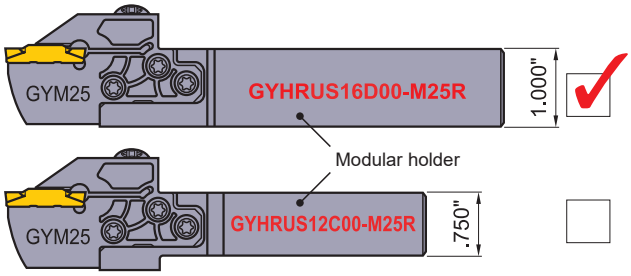


■Recommended feed rate and depth of cut



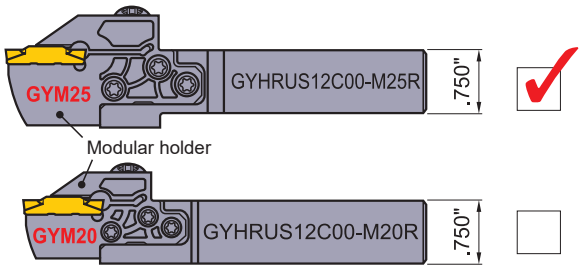
Notes when selecting the tool body

Modular holder



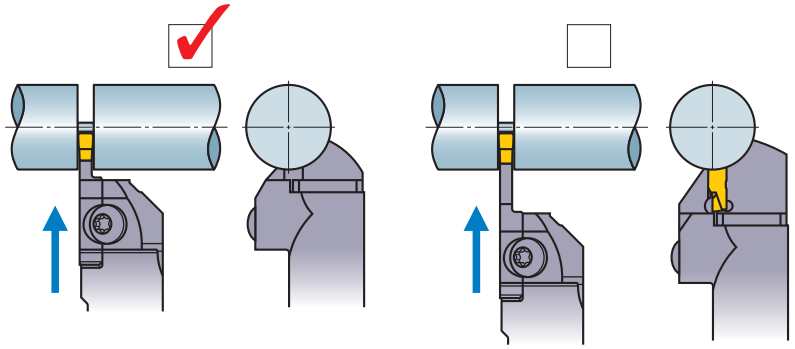
●To ensure sufficient clamping rigidity, select a modular holder with the largest possible shank size.

Modular blade (1)



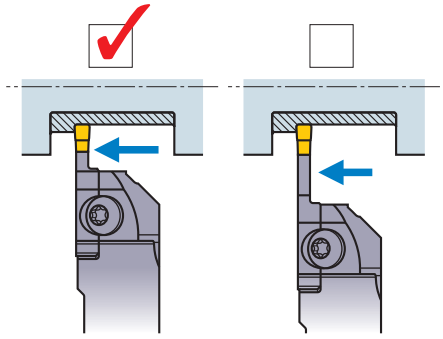
●If there is no restriction for use, select the largest modular blade for the same shank size.

Modular blade (2)



●Select the shortest possible blade suitable for the application.

Modular blade (3)

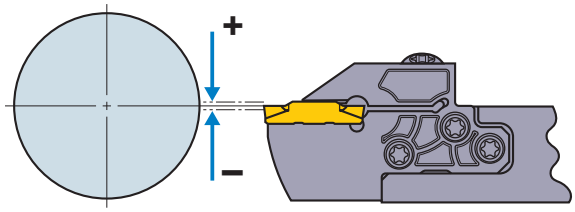


●Select the shortest possible blade suitable for the application.

✓: **Recommended.**

Notes when setting the tool

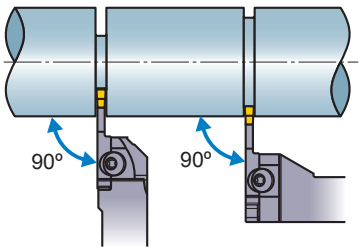
Setting of cutting edge height



<Grooving/Cross-feed machining>
Set the cutting edge height to ±.004" parallel to the central axis.

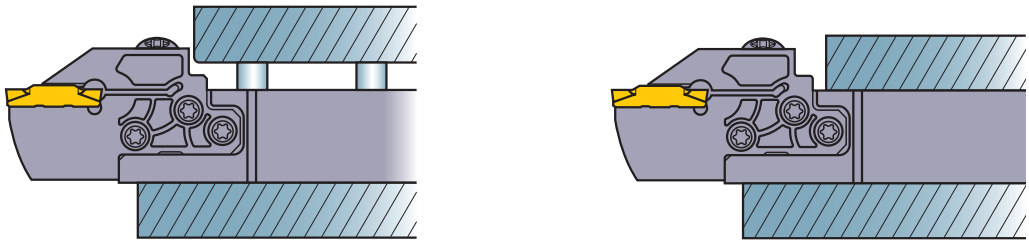
<Cutting off>
Set the cutting edge height to 0–+.008" parallel to the central axis.

Tool body setting angle



●Set the insert perpendicular to the central axis.

Overhang

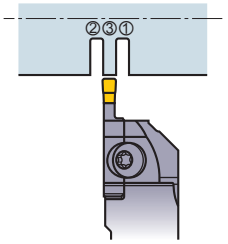


●When setting the tool, ensure that the overhang is as short as possible and avoid the step difference part as above figure shows.

MACHINING RECOMMENDATIONS

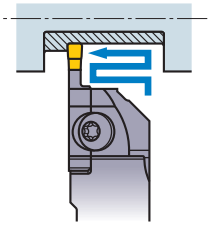
Notes on multi-functional machining (MF·MS and MM breakers)

Machining narrow grooves



●It is recommended to carry out plunging in several passes. Following the steps above makes it difficult for chips to elongate. This also improves the accuracy of workpiece wall surface.

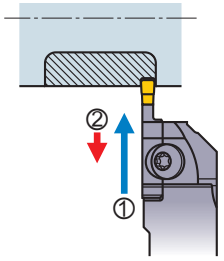
Machining wide grooves



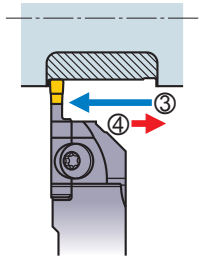
●It is recommended that cross-feed machining is used.

Machining wide grooves

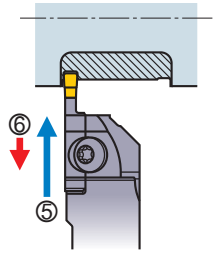
Roughing



①Carry out grooving.
②Retract the tool approx .004".

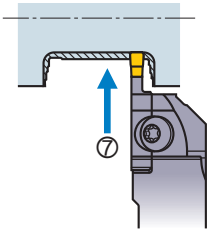


③Carry out cross feed machining.
④Retract the tool approx .004".

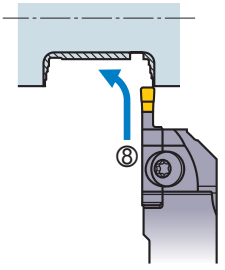


⑤Carry out grooving.
⑥Retract the tool approx .004".
* Repeat the steps ①–⑥.

Finishing

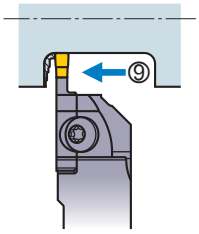


⑦Carry out grooving to the end point of the corner radius.

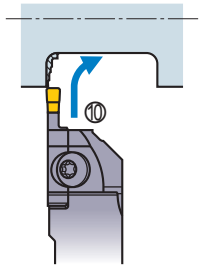


⑧Machining of the wall surface, corner radius and bottom face should be carried out in one process.

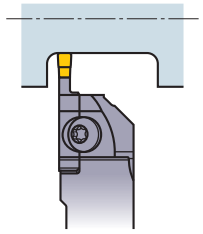
Finishing



⑨Stop at the bottom of the corner radius.

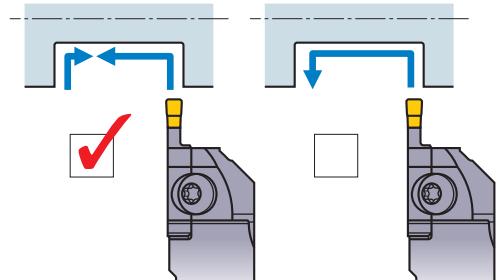


⑩Machine the counter wall to the corner radius in one process.



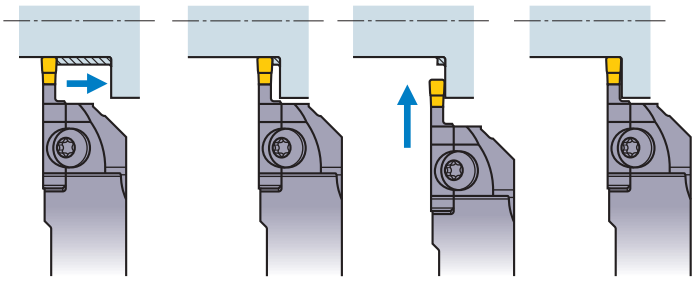
⑪Finish machining.

Precautions when finishing walls



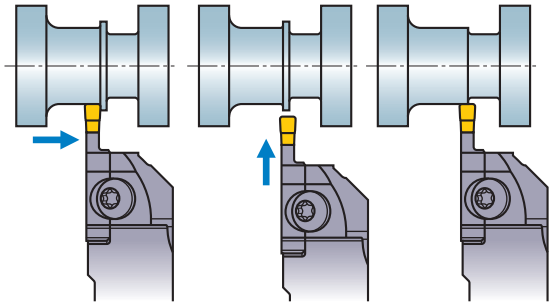
●To produce high accuracy walls using MS or MM breaker insert, do not carry out back turning. Plunging is recommended.

Wall machining



●When machining a wall, chip jamming can occur. In this case, stop cross feed machining just before the wall (at a point less than the insert width) then remove the remaining material by plunging.

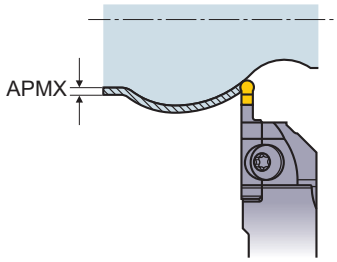
Machining of a ring section



●When a ring remains in a cross feed end process, finish cross feed machining .040"–.059" short of the end point, then remove the ring by plunging.

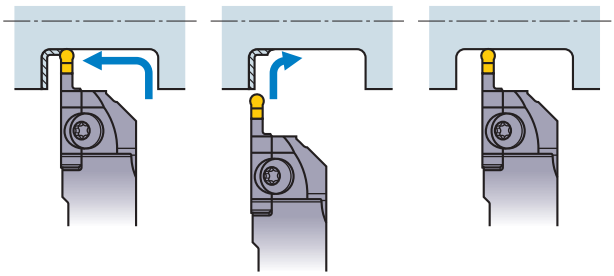
Notes on multi-functional machining (BM breaker)

Copying



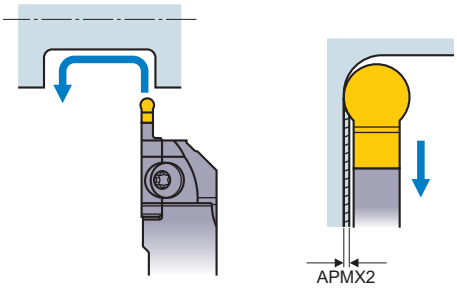
●With the BM breaker insert, 3 dimensional copying is possible.
Set the depth of cut (APMX) to 40% less than the insert width.

Roughing



●Use plunging and cross-feed machining.
When machining the corner, vibration is likely to occur. To avoid this, reduce the feed by 50%.

Finishing



●Carry out finishing in one process.
For the depth of cut (APMX2) when back turning, refer to the table on the right.

Insert	APMX2 (inch)
GY2M0200D100N-BM	.002
GY2M0250E125N-BM	.004

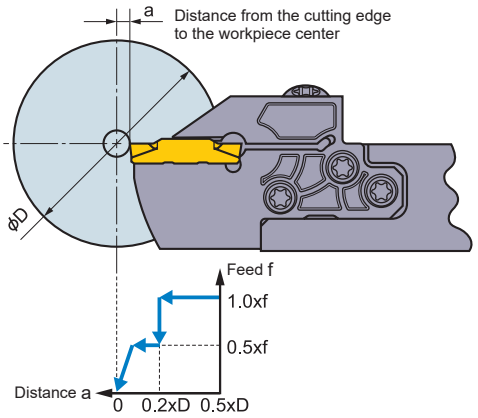
GY2M0600J150N-BM	.012
GY2M0635J318N-BM	
GY2M0800K400N-BM	.016

MACHINING RECOMMENDATIONS

Notes for cutting off

feed

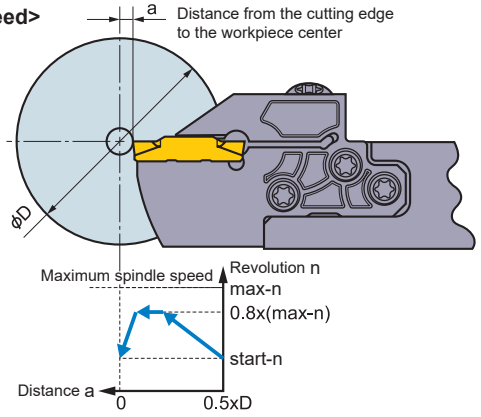
<Feed>



- When the cutting edge approaches the center, reduce the feed by 50%.
- If necessary, stop the feed prior to reaching the center of the workpiece. The part will fall off because of its own weight.

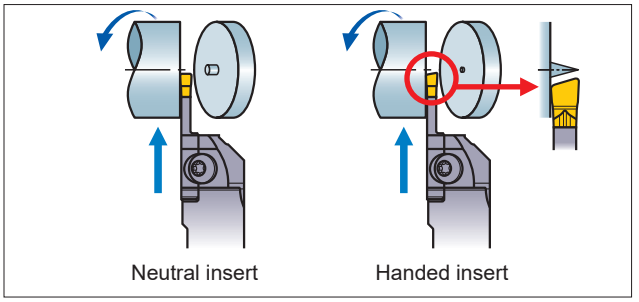
Revolution

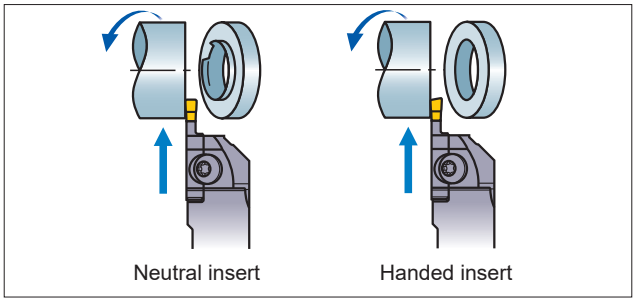
<Spindle speed>



- When using constant cutting speed during a cutting off cycle, it is recommended to limit the spindle speed to 80% of maximum to ensure stability.
- To prevent the workpiece from being expelled, lower the spindle speed before finishing the grooving operation.

insert

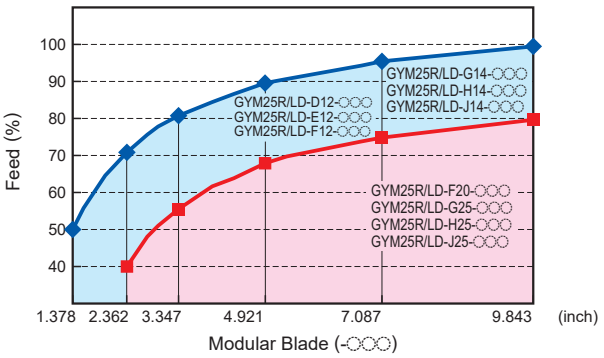




- When there is a center stub on solid bar work or burrs are formed on pipe material, it is possible to decrease them by using a handed insert. With a handed insert, machining tends to be less stable when compared to using a neutral insert. Pay special attention to avoid fracturing of the cutting edge and decrease the feed when necessary.

Memo

RELATIONSHIP BETWEEN THE MODULAR BLADE AND FEED PER ROTATION [For Face Grooving]



Note 1) Adjust the feed per rotation in the cutting conditions to the percentage shown in the table above.

RECOMMENDED CUTTING SPEED (SFM) [For Face Grooving]

	Work Material	Hardness	Grade	Cutting Speed (SFM) 165 330 490 655 820 985
P	Mild Steel	≤160HB	VP20RT	260–590
			VP10RT	295–620

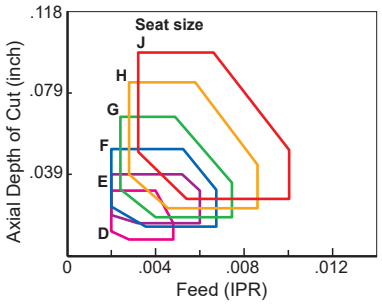
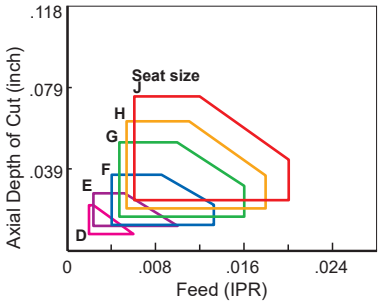
TRAVERSE MACHINING (MM/MS BREAKER)



TRAVERSE MACHINING (BM BREAKER)

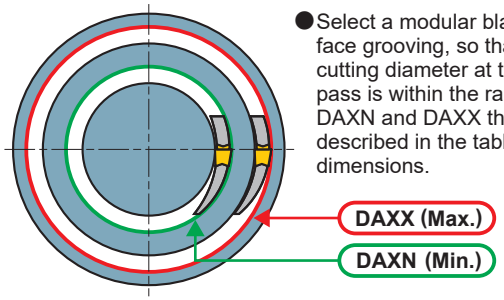


Note 1) GL chip breaker is not recommended for face grooving.

TOOL SELECTION

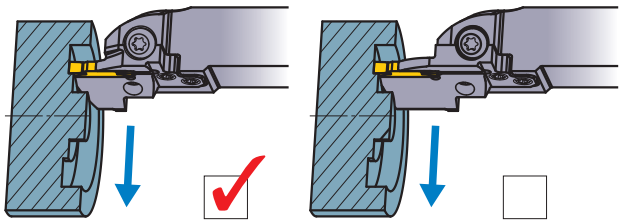
Notes when selecting the tool body

Modular blade (1)



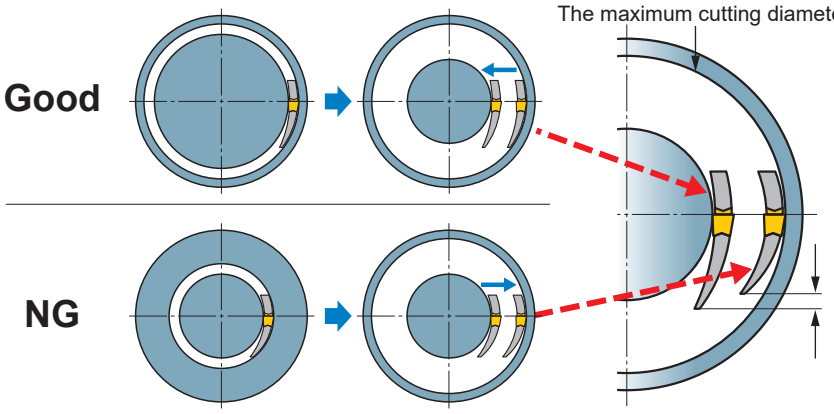
●Select a modular blade for face grooving, so that the cutting diameter at the first pass is within the range of DAXN and DAXX that are described in the table of dimensions.

Modular blade (2)



●Select the shortest possible blade suitable for the application.

Modular blade (3)



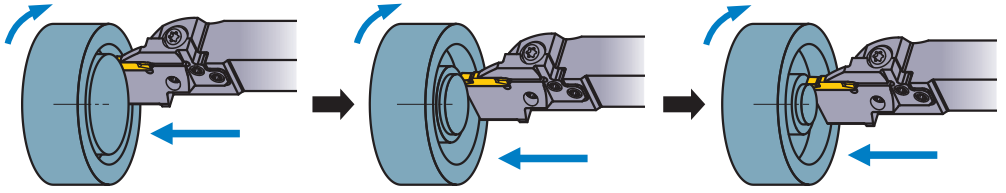
●Select the largest size blade within the maximum cutting diameter of the workpiece.

●Machine from the outer diameter towards the center.

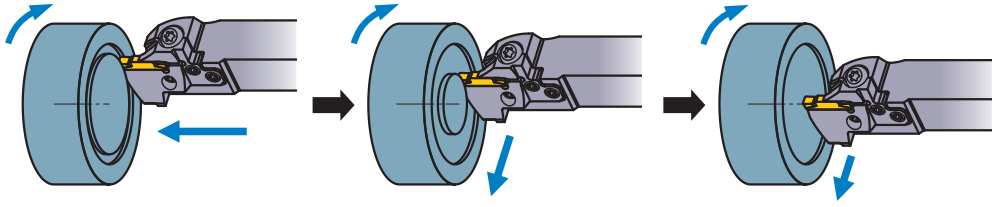
●Increased machining stability and rigidity is possible if a modular blade with the largest possible back metal is used.

●At first, machine the maximum cutting diameter, there is no restriction in the cutting diameter on the remaining process.

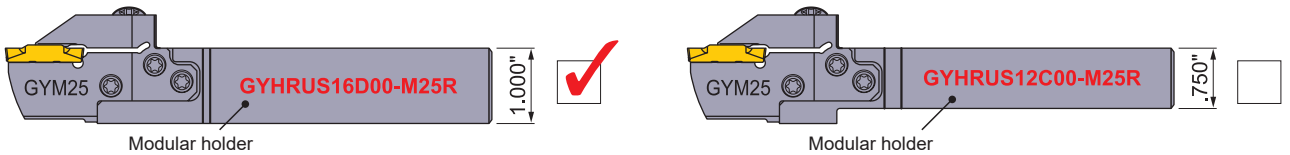
● When plunging in several passes.



● When combining plunging and infeed machining.



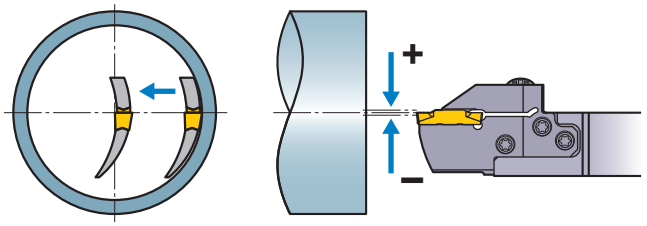
Modular holder



●To ensure sufficient clamping rigidity, select a modular holder with the largest possible shank size.

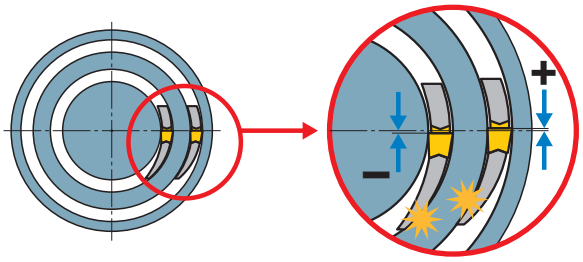
Notes when setting the tool

Setting the cutting edge height



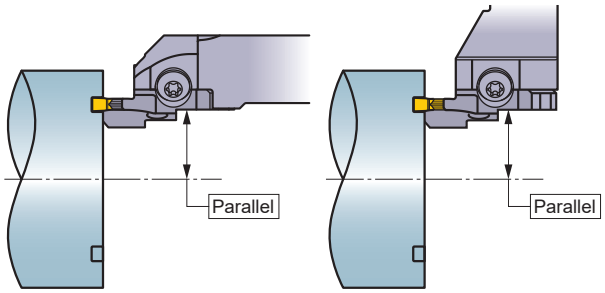
●Set the cutting edge height to ±.004" parallel to the central axis.
●Cutting edge center height check should be done by traverse machining towards the center with a very small depth of cut and ensure that an even surface and no material remains at the center point afterwards.

When interfering the wall of groove and the Modular blade



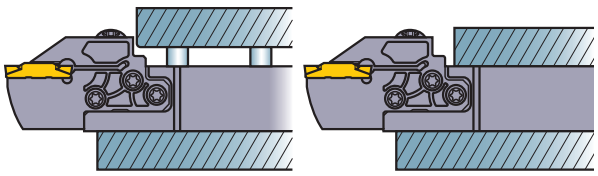
●If interference occurs even when the correct blade is used, the cutting edge height could be incorrect.
When interference occurs on the inner side of the blade, the cutting edge height is set too high.
When interference occurs on the outer side of the blade, the cutting edge height is set too low.

Setting the tool



●Set the insert parallel to the central axis.

Tool overhang



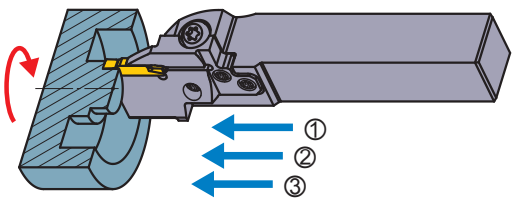
●When setting the tool, ensure that the overhang is as short as possible and avoid the step difference part as above figure shows.

MACHINING RECOMMENDATIONS

Notes when face grooving

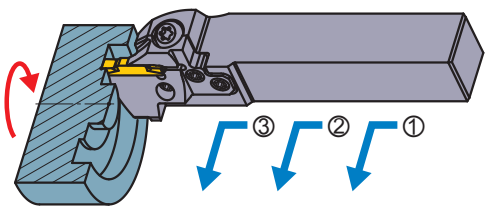
●**Always machine from the outer diameter towards the center.**

Machining narrow grooves



●Plunging in several passes is recommended.

Machining wide grooves

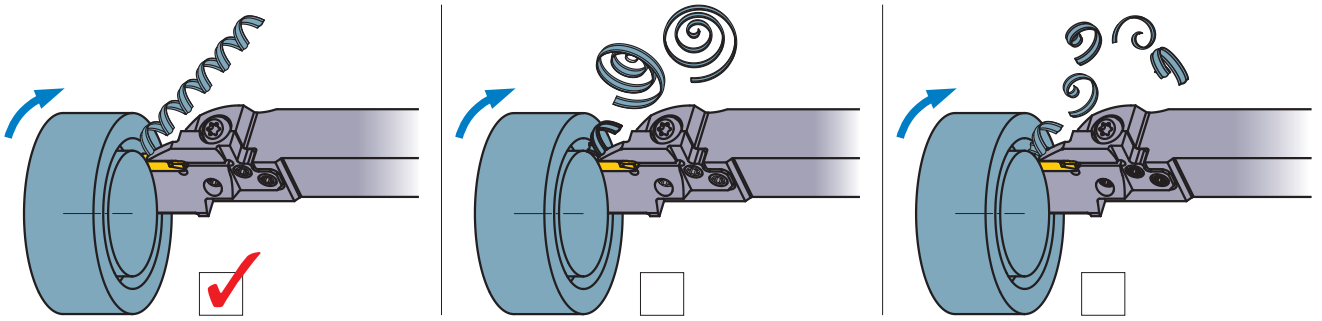


●Cross feed machining is recommended.

MACHINING RECOMMENDATIONS

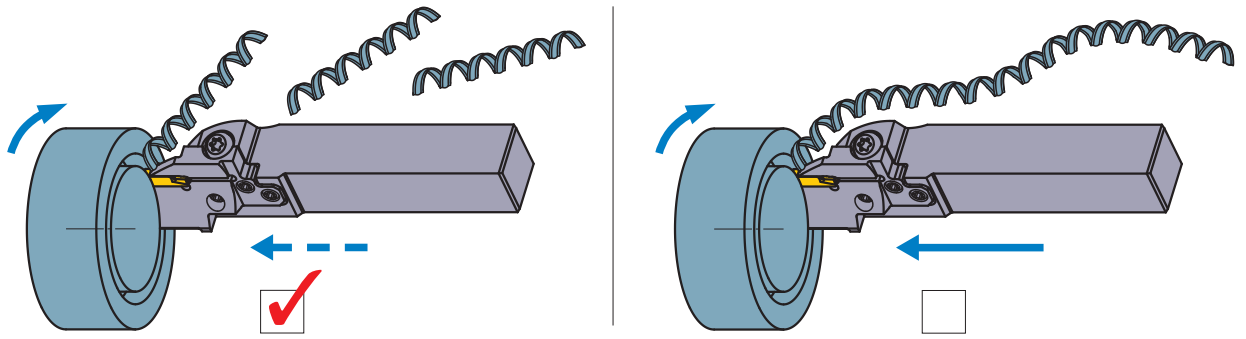
Notes when face grooving

Notes on the first pass (1)



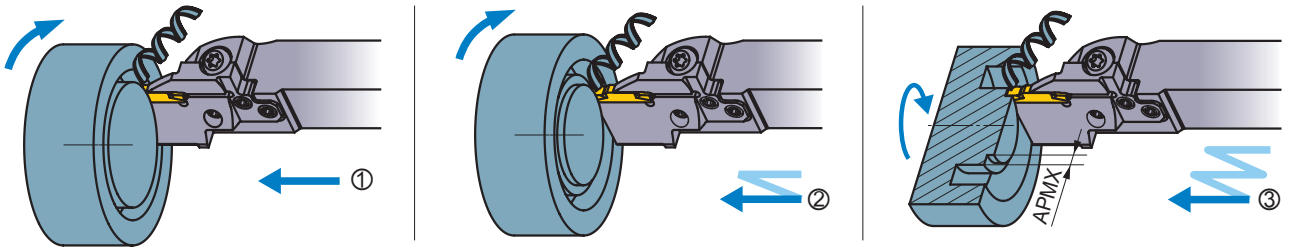
●During the first face grooving pass it is difficult to disperse broken chips and can lead to problems such as a chipped insert. Maintain longer chips that disperse easily by decreasing the feed per rotation.

Notes on the first pass (2)



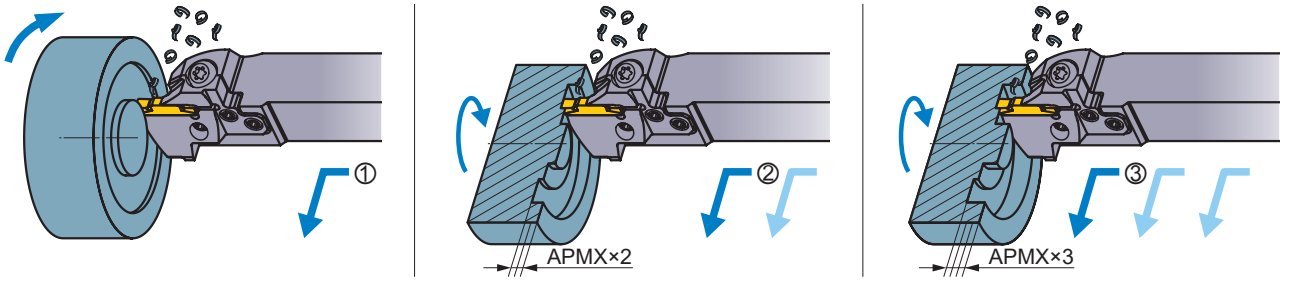
●When chips become too long, use peck feed to break them into a suitable length.

Notes when wide face grooving by plunging in several passes.



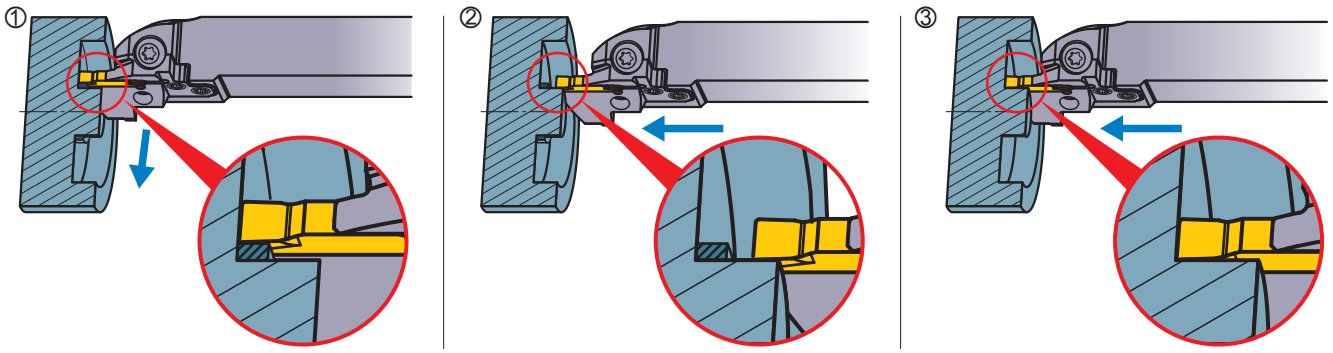
●When machining a face groove in several passes, machine from the outer diameter towards the center so that space for discharging chips is created to prevent insert damage caused by chip jamming.
●Plunging width of cut is recommended to be set at 60 - 80% of the insert width. This enhances the effect of the chipbreaker by enlarging the width of the groove to improve chip dispersal.

Notes when wide face grooving by combination of plunging and traverse machining (1)



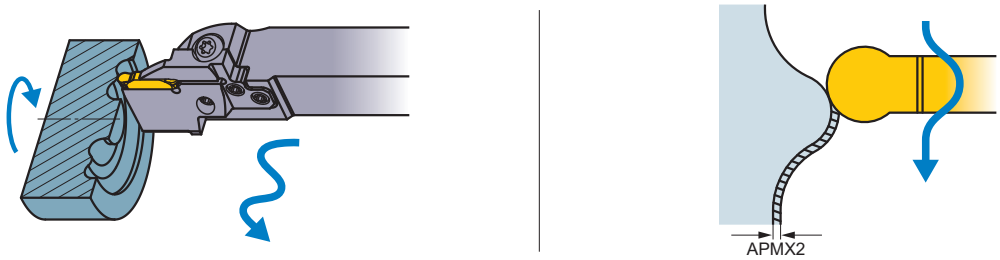
●When face groove machining by using plunge feed and traverse machining, always machine from the outer diameter towards the center to disperse chips outward to avoid chip jamming problems.
●Set the depth of cut within 40% of the insert width.

Notes when wide face grooving by combination of plunging and traverse machining (2)



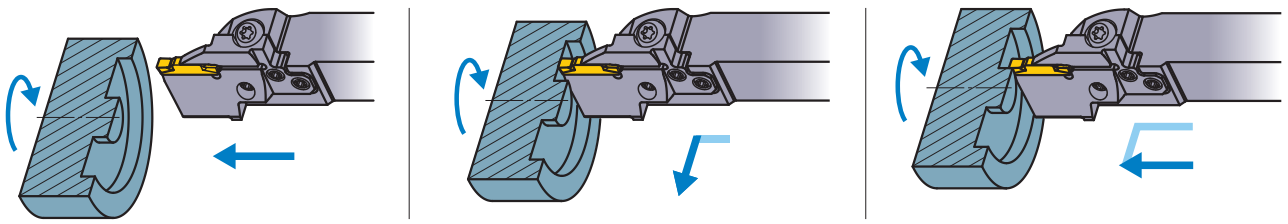
●When infeed machining at the bottom of deep groove, chips may interfere on the cutting edge near the center wall.
In such cases, stop infeed machining just before the center wall (at a point less than the insert width) then remove the remaining material by plunging.

Notes when copying (BM Breaker)



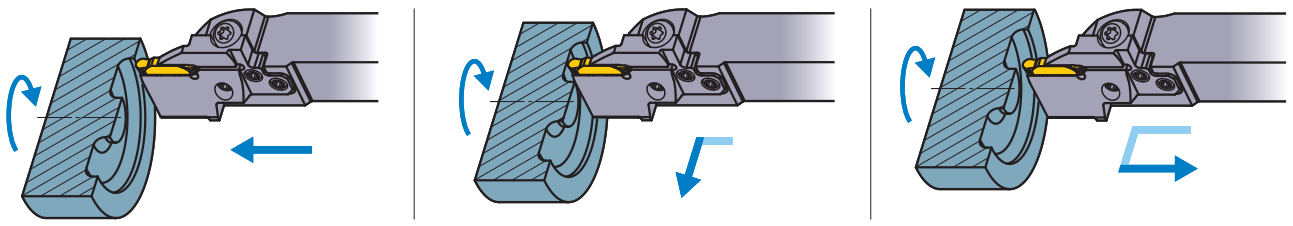
●With the BM breaker insert, 3 dimensional copying is possible. Set the depth of cut (APMX2) to 30% of the insert width.

Finishing (1)

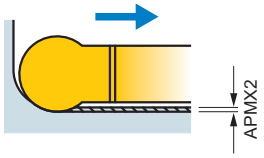


●When finish cutting, machine continuously from the outer wall to the bottom of the groove, then finally plunge cut the center wall.

Finishing (2) (BM Breaker)



●Carry out finishing in one process.
For the depth of cut (APMX2) when back turning, refer to the table on the right.



Insert	APMX2 (inch)

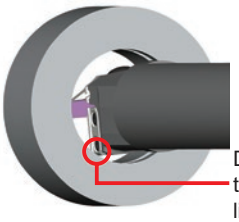
LIMITATION OF THE MAXIMUM GROOVE DEPTH [For Internal Grooving]

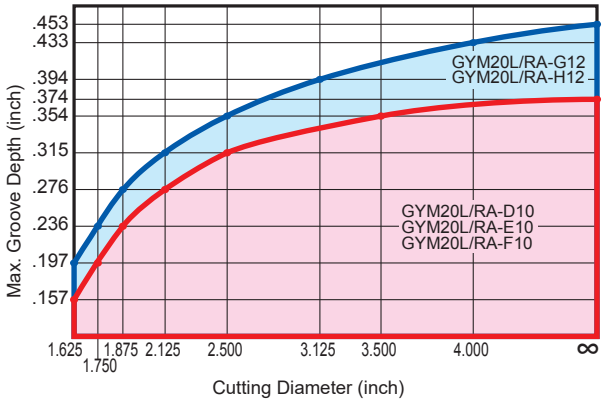
•When using the mono block type
The maximum groove depth is not limited by the cutting diameter.

•When using the modular blade type
The maximum groove depth is limited by the cutting diameter.

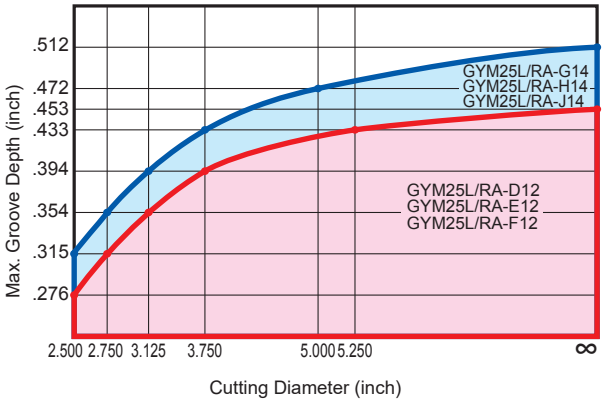


Due to interference of this part, the maximum groove depth is limited by the cutting diameter.

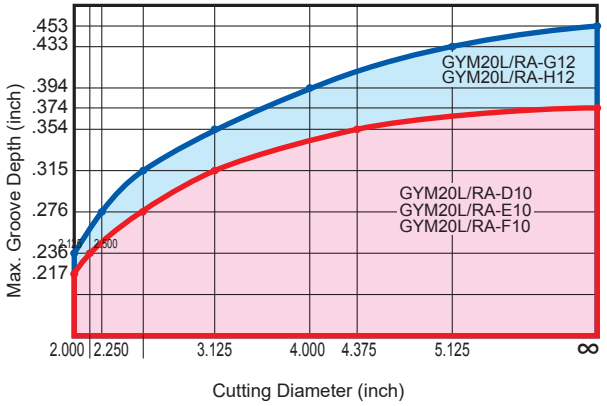
Shank Diameter=1.250 inch (GYM20 Blade)



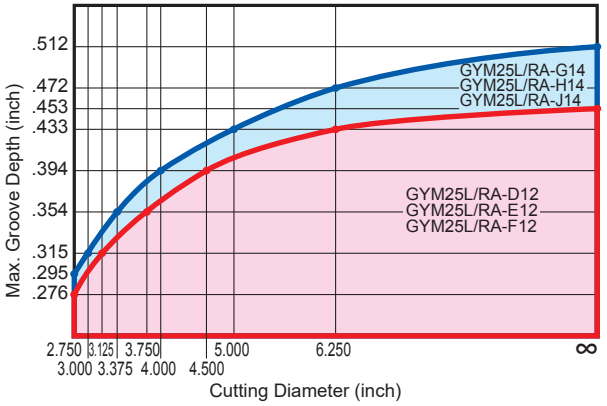
Shank Diameter=1.500 inch (GYM25 Blade)



Shank Diameter=1.500 inch (GYM20 Blade)



Shank Diameter=2.000 inch (GYM25 Blade)

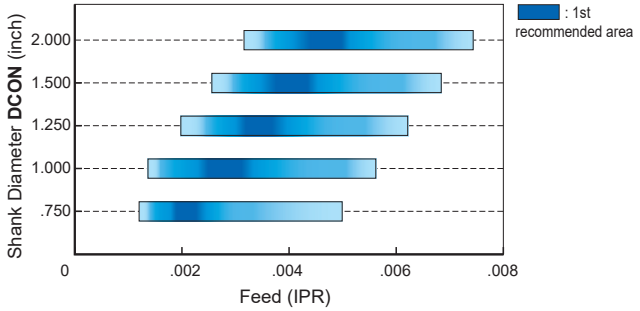


RECOMMENDED CUTTING SPEED (SFM) [For Internal Grooving]

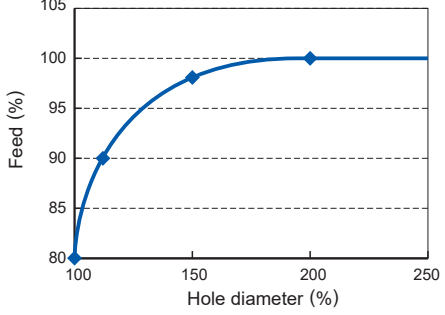
	Work Material	Hardness	Grade	Cutting Speed (SFM) 165 330 490 655 820 985 1310
P	Mild Steel	≤160HB	VP20RT	260 – 590
			VP10RT	295 – 620
			NX2525	230 – 560
	Carbon Steel Alloy Steel	160–280HB	VP20RT	195 – 460
			VP10RT	230 – 490
			MY5015	295 – 690
			NX2525	180 – 440
		≥280HB	VP20RT	165 – 360
			VP10RT	195 – 395
			MY5015	260 – 525
			NX2525	150 – 345
M	Stainless Steel	≤270HB	VP20RT	165 – 360
			VP10RT	195 – 395
K	Gray Cast Iron	Tensile Strength ≤300MPa	VP20RT	195 – 460
			VP10RT	230 – 490
			MY5015	295 – 690
	Ductile Cast Iron	Tensile Strength ≤800MPa	VP20RT	165 – 360
			VP10RT	195 – 395
			MY5015	260 – 525
S	Heat Resistant Alloy Titanium Alloy	–	MP9015	130 – 330
			MP9025	100 – 295
			VP20RT	100 – 195
			VP10RT / RT9010	130 – 230
H	Hardened steel	≥50HRC	BC8110	195 – 330
N	Aluminum Alloy	Content Si<5%	RT9010	490 – 1310
	Aluminum Alloy	Content 5%≤Si≤10%	RT9010	490 – 1310
	Aluminum Alloy	Content Si>10%	RT9010	260 – 525

Note 1) For MP9015, MP9025, VP10RT, VP20RT and MY5015, wet cutting is recommended.

GROOVING

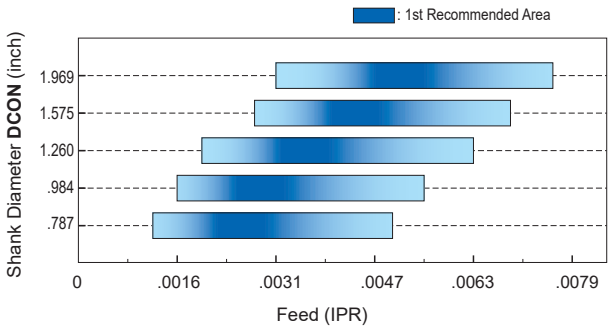


Note 1) The cutting diameter 100% represents the minimum cutting diameter (DMIN).
Note 2) The graph on the left shows the cutting conditions when setting the feed to 100%.

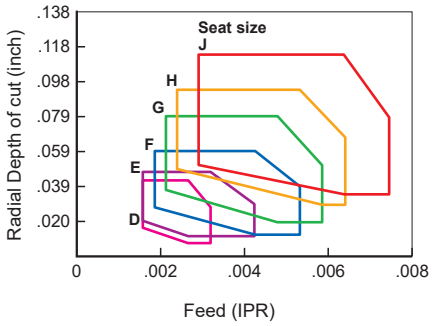


RECOMMENDED CUTTING CONDITIONS [For Internal Grooving]

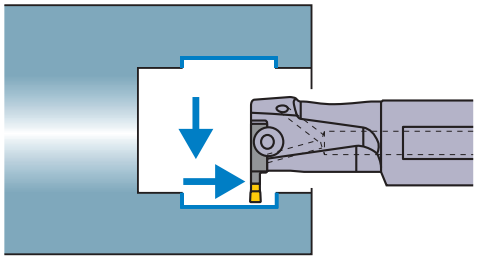
GROOVING (GL BREAKER)



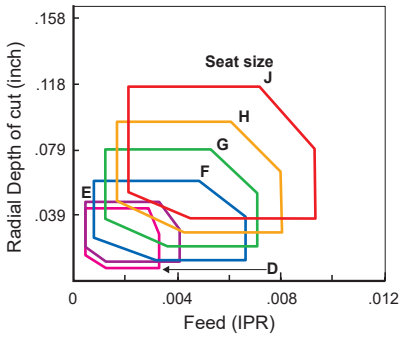
TRAVERSE MACHINING (MF BREAKER)



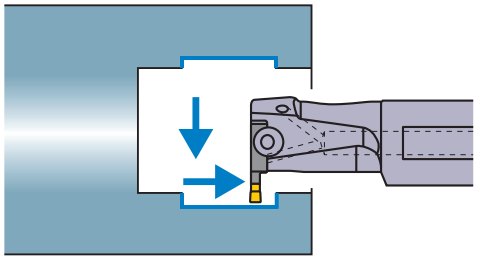
●When traverse machining a blind hole, it is recommended to carry out back turning considering chip disposal.



TRAVERSE MACHINING (MM/MS BREAKER)

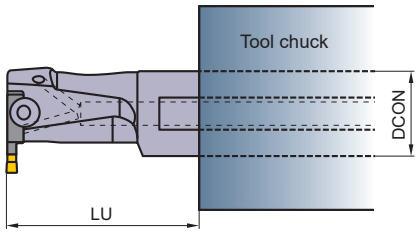


●When traverse machining a blind hole, it is recommended to carry out back turning considering chip disposal.



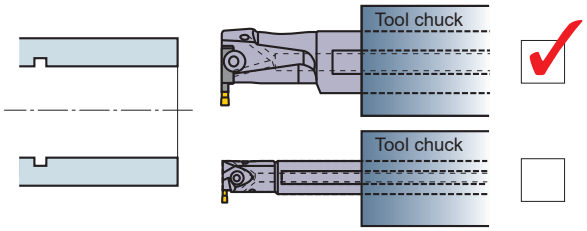
Note 1) The above cutting conditions are for when using the tool overhang (LU) 1.6-2.0 times larger than the shank diameter (DCON). (L/D=1.6-2.0)
When using L/D larger than 2.0, reduce the cutting conditions.

Seat Size / Insert Width	
D	.079", 2.00 mm .088", 2.24 mm
E	.094", 2.39 mm .098", 2.50 mm .108", 2.74 mm
F	.118", 3.00 mm .125", 3.18 mm .128", 3.24 mm
G	.157", 4.00 mm .167", 4.24 mm
H	.187", 4.75 mm .197", 5.00 mm .206", 5.24 mm
J	.236", 6.00 mm .248", 6.31 mm .250", 6.35 mm



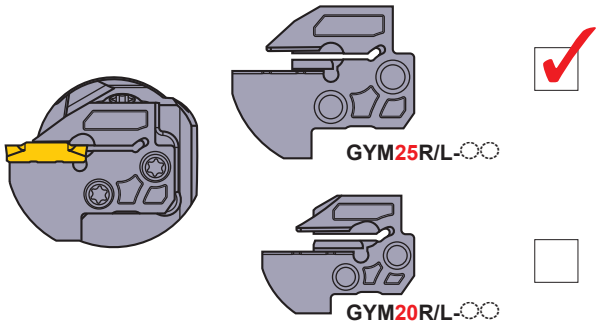
Notes when selecting the tool body

Holder



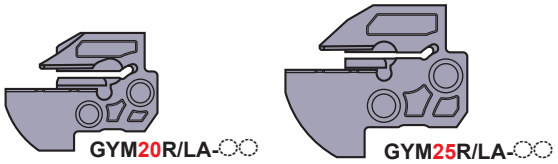
●When the overhang is the same, select a holder with the largest possible shank size to ensure sufficient clamping rigidity.

Modular blade (1)



●For a ø1.5" & ø40 mm shank holder, if there is no restriction for use, select a holder suitable for GYM25 blade.

Modular blade (2)

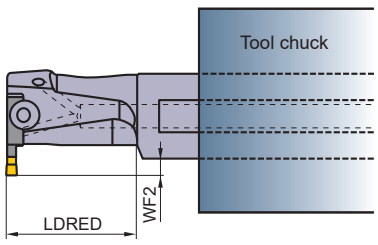


GYM20R/LA-D10	GYM25R/LA-D12
GYM20R/LA-E10	GYM25R/LA-E12
GYM20R/LA-F10	GYM25R/LA-F12
GYM20R/LA-G12	GYM25R/LA-G14
GYM20R/LA-H12	GYM25R/LA-H14
	GYM25R/LA-J14

●For an internal holder, select a modular blade listed above.

Notes when setting the tool

Overhang



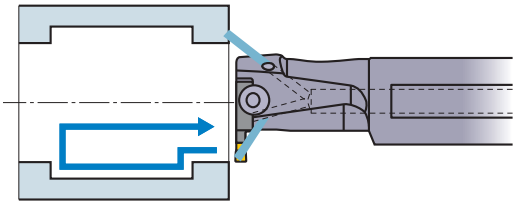
●The maximum groove depth is limited to the dimension LDRED. When machining with longer overhangs, refer to the dimension WF2 of the tool used.

MACHINING RECOMMENDATIONS

Notes on multi-function machining (MF, MS and MM breakers)

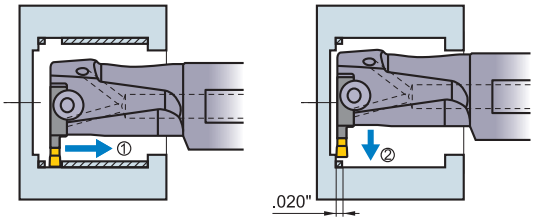
For internal grooving, the machining methods for external grooving (F202 – F203) can be used, but please note the following precautions.

Coolant



●Supply large amounts of coolant for effective chip disposal during cutting. Maintain supply until the tool has been retracted completely for improved chip disposal.

Machining blind holes

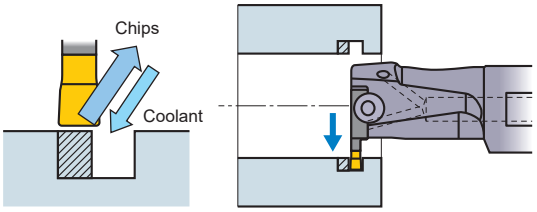


●As continuous chips tend to elongate at the back of the bore, the above operation is recommended.
The recommended width of cut for ② is .020 inch.

Machining Wide Grooves

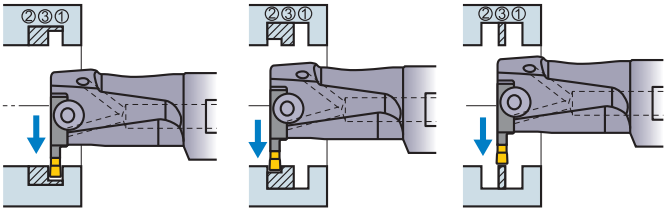
Grooving

●When the insert width is x 2 ≥ groove width



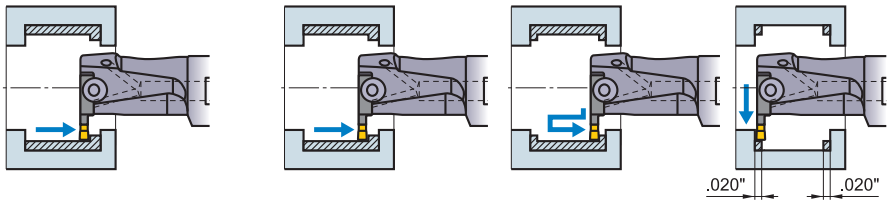
●When the depth of cut is shallower than the insert width, continuous chips are usually produced. When plunging in several passes, it is recommended to carry out machining in the steps above. This ensures that coolant reaches the cutting edge and chips are easily discharged.

●When the insert width is x 2 < groove width



●When the groove depth is larger than the insert width, carry out plunging in the steps above to break up chips efficiently.

Turning

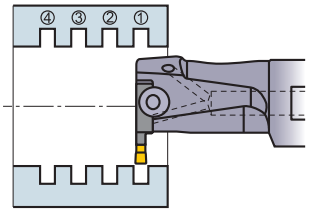


●When chip breaking and disposal are especially important, cross-feed machining is recommended.

●Wide face grooving when the corner R of the workpiece is equal to the corner R of the insert, machine as shown above. (When corner R of the workpiece is larger than corner R of the insert, refer to the description of external wide grooving.)

●If the groove depth exceeds a given level, chips may elongate at the wall. In such a case, increase the feed and carry out machining as shown above.

Machining instruction



●It is recommended to carry out grooving from the front end of the workpiece. This reduces workpiece deflection.

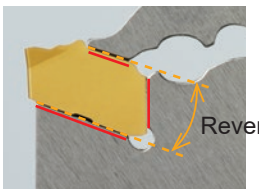
Memo

GW Series
Easy to Utilize Configuration that Improves Tool Handling

Clamp

Simple insert clamping method offering high rigidity.

To prevent the insert from being pulled out during machining a reverse taper angle has been designed from the front of the insert. Additionally the design also includes 3 large locating faces between the insert and the blade offering increased cutting edge reliability. The blade itself is made from a special alloy steel to suit this application.
In respect to insert indexing, a unique wrench is supplied to ensure ease when changing the insert.



Reverse Taper Angle

Voice of Developer

Just how easy is it to set an insert?

With the use of a unique wrench, it is possible to locate and remove the insert with one simple action making it easier for use in the workplace.

Through Coolant Blade

Increased wear resistance due to the use of 2 through coolant ejection holes.

2 through coolant holes supply the coolant to both the rake and flank face, leading to effective cutting edge cooling and increased wear resistance.
Additionally this blade can also be used for both low pressure and high pressure coolant (1000 PSI).

Voice of Developer

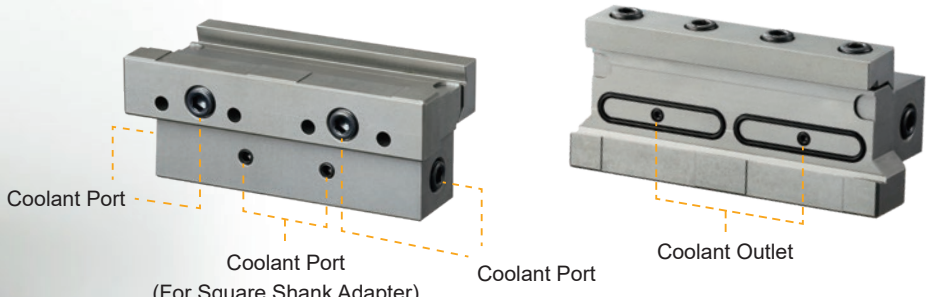
How is it possible to reduce heat generation?

The 2 coolant holes used in the blade are capable of using high coolant pressures of up to (1000 PSI). This is achieved by using as large as possible through coolant hole diameter.
The ejection holes are located close to the cutting edge to improve the cutting edge cooling effect and increasing wear resistance.

Coolant Ports

Flexible set up possible with the use of 6 coolant ports.

There are 6 coolant ports designed into the tool block. This makes it easier for the end user to set up the tool block and blade to a configuration that suits their needs. If necessary it is also possible to use coolant hose. The ejection type coolant also improves cutting edge cooling and chip evacuation.



Voice of Developer

Possible set up to suit the requirements of the workplace environment.

One of the objectives of this product is to respond to the customers complaints that “the product did not fit and could not be used”. Starting with the coolant outlet that prevents leaks even when oil quantity or overhangs change.
Everything from the material and the shape of the O-ring, to the length of the hose has been tailored to the effective use in the workplace.

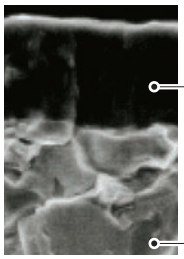
Insert Grades

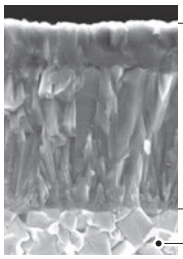
Work Material / Machining Condition	P Steel	M Stainless Steel	K Cast Iron	S Heat Resistant Alloy / Titanium Alloy
Stable ↑ Machining Condition ↓ Unstable	MY5015	VP10RT	MY5015	VP10RT
	VP10RT	VP20RT	VP10RT	VP20RT
	VP20RT	VP30RT	VP20RT	
	VP30RT			

VP20RT (1st Recommendation)



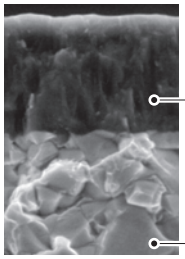
● PVD coated grade suitable for a wide range of applications. The combination of a special tough cemented carbide substrate with MIRACLE coating provides an excellent balance of wear and fracture resistance.

MY5015



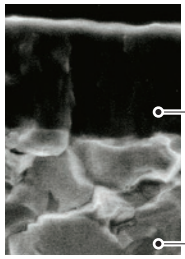
● MY5015 is a CVD coated grade with excellent wear resistance even at high temperatures. It provides longer tool life when machining cast and ductile cast iron. Also suitable for high speed continuous cutting of steels.

VP10RT



● PVD coated grade with a cemented carbide substrate harder than VP20RT. For use on difficult-to-cut materials and for extending tool life.

VP30RT



● A combination of a tough, special cemented carbide substrate and MIRACLE coating. Ideal for heavy interrupted cutting of stainless and general steels.

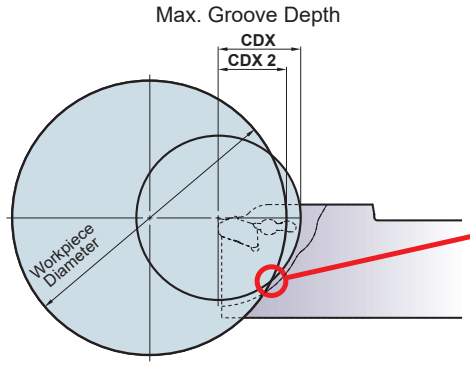
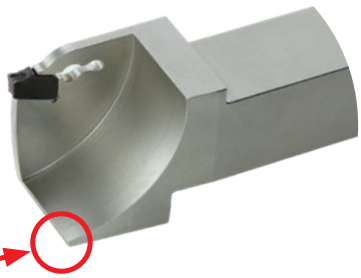
LIMITATION OF THE MAXIMUM GROOVE DEPTH [For External Grooving]

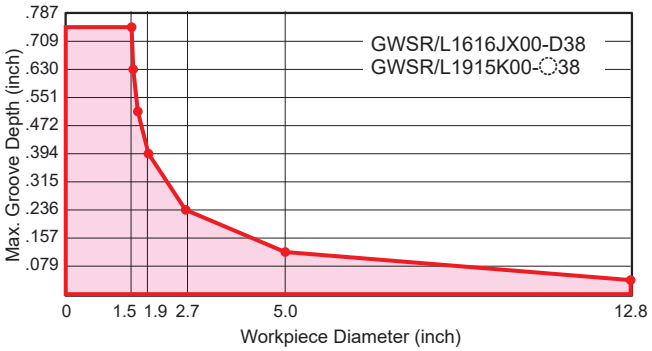
•For Swiss-type lathes mono block holder

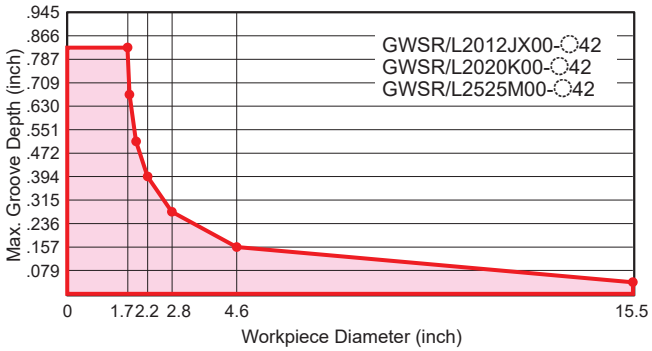
The maximum groove depth is limited by the workpiece diameter.

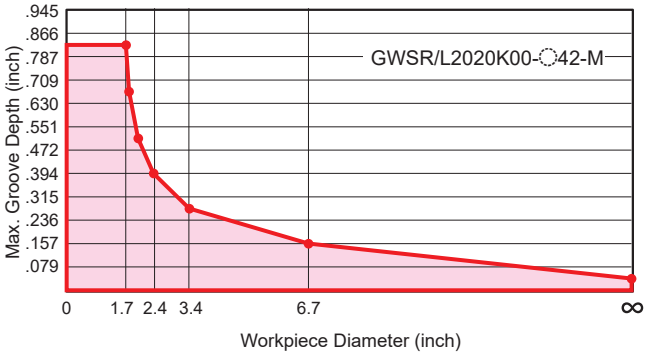


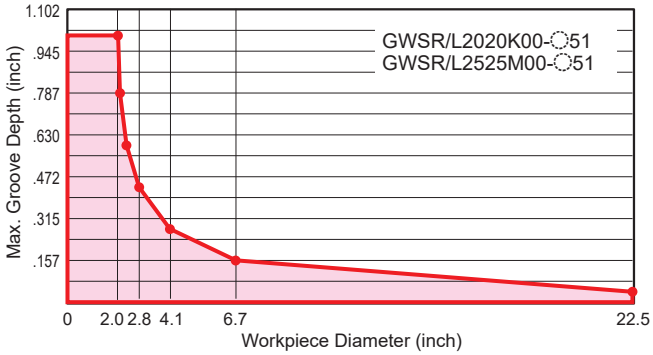


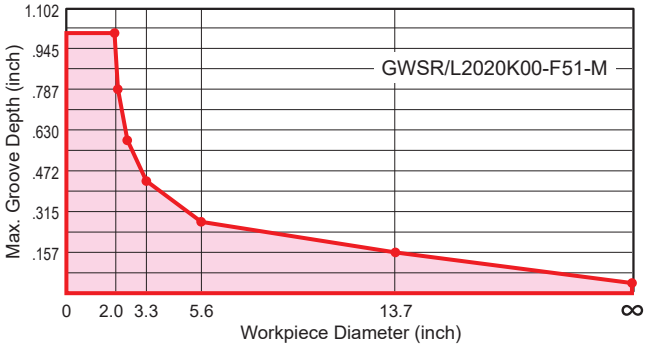
Due to the interference on this part, the maximum groove depth is limited by the workpiece diameter.

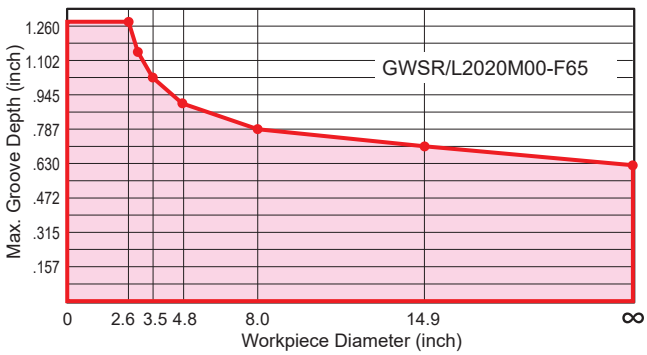


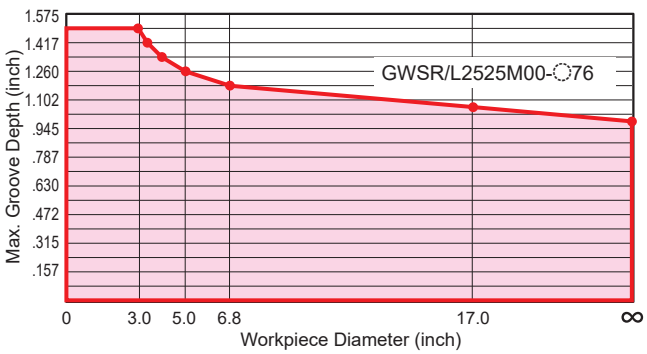












F TYPE BORING BAR

- Min. cutting diameter 10 mm.
- Screw-on type.
- Usable for various applications.
- Max. groove depth: 3 mm.

HOW TO READ THE STANDARD OF THREADING

●How this section page is organized

①Classified according to external or internal applications.
②Sub-classified according to product series.
(Refer to the index on the next page.)

FIGURE SHOWING THE TOOLING APPLICATION
uses illustrations and arrows to depict the available machining applications, such as external and internal threading.

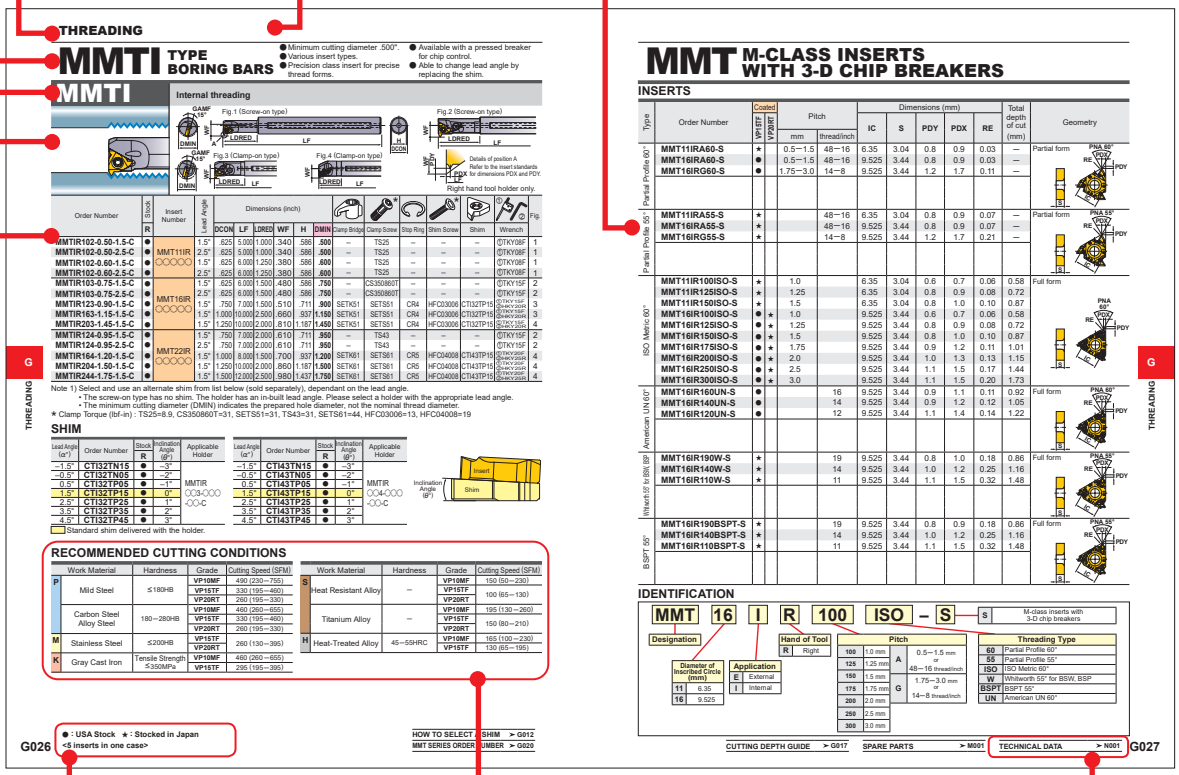
TYPE OF TOOL HOLDER
indicates the initial letters for the order number and cutting applications.

TITLE OF PRODUCT

PRODUCT SECTION

INDICATION OF EXTERNAL /INTERNAL APPLICATION

STANDARDS FOR APPLICABLE INSERTS
indicates stock status, dimensions, etc. for applicable inserts.



LEGEND FOR STOCK STATUS MARK
is shown on the left hand page of each double-page spread.

PAGE REFERENCE
·SPARE PARTS
indicates reference pages, including the above, on the right hand page of each double-page spread.

PRODUCT STANDARDS
indicates order numbers, stock status (per right/left hand), applicable inserts, holder dimensions, and spare parts.

RECOMMENDED CUTTING CONDITIONS
for each work material classification, indicates recommended cutting conditions according to the ISO categories for cutting grades, P, M, K, S, and H.

●To Order : For holder, please specify order number and hand of tool (right/left).
For insert, please specify insert number and grade.

CLASSIFICATION (EXTERNAL THREADING)

Name of Tool Holder	Insert Shape	Features
MMTE Holder G021		● Various insert types. ● Precision class insert for precise thread forms. ● Available with a pressed breaker for chip control. ● Able to change lead angle by replacing the shim.

CLASSIFICATION (INTERNAL THREADING)

Name of Tool Holder	Insert Shape	Features
MMTI **Boring Bars** G026		● Minimum cutting diameter .500 inch. ● Various insert types. ● Precision class insert for precise thread forms. ● Available with a pressed breaker for chip control. ● Able to change lead angle by replacing the shim.
FSL5 **S-SL5** **Boring Bars** G031 G032		● Screw-on type. ● Precision class insert. ● Holder is capable of performing both grooving and threading. ● Maximum groove depth .118 inch.
MICRO-MINI TWIN **Boring Bars** G034	–	● Solid carbide type. ● Economical due to single holder with two cutting edges.
MICRO-MINI **Boring Bars** E031	–	● Solid carbide type. ● Insert can be ground to suit the application.

G3/4		.949"
G7/8		1.098"
G1	11	1.193"
G1·1/8		1.376"
G1·1/4		1.534"

Note 1) Same as PF.

● Taper Pipe Threads R(PT), Rc(PT)

Thread Type	Number of threads	Standard internal diameter
R1/16	28	.258"
R1/8		.337"
R1/4	19	.451"
R3/8		.589"
R1/2	14	.734"
–	–	–
R3/4	14	.949"
–	–	–
R1	11	1.193"
–	–	–
R1·1/4	11	1.534"

Note 1) Same as Rc and PT.

· The pitch is pre-determined for each nominal diameter. Note the minimum machining diameter especially when internal threading.

FEATURES OF MMT SERIES

■A WIDE VARIETY OF CHOICES

Mitsubishi Miracle Threading (MMT) series contains 297 inserts and 23 holders.

M-CLASS INSERTS WITH 3-D CHIP BREAKERS

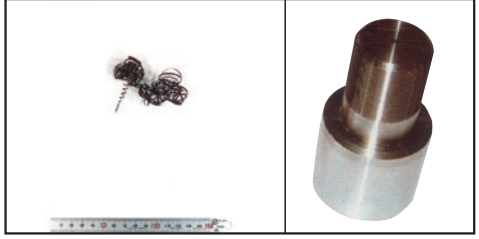
G-CLASS GROUND INSERTS

■IDEAL CHIP CONTROL EVEN IN THE LATTER HALF OF PASSES WHEN CONTINUOUS CHIPS ARE USUALLY PRODUCED. (M-CLASS INSERTS WITH 3-D CHIP BREAKERS)

ISO metric external thread pitch 1.5 mm Final pass (6th pass)

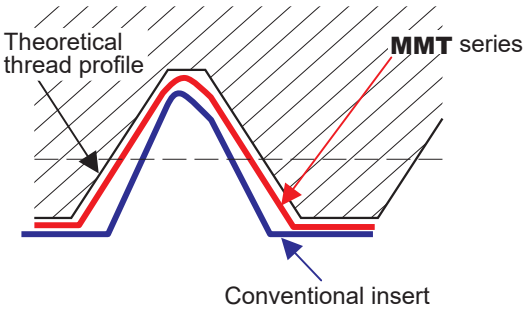
Competitor

MMT



<Cutting Conditions>
Work Material : AISI 4140
Insert : MMT16ER150ISO-S
Grade : VP15TF
Cutting speed : 395 SFM
Cutting method : Radial Infeed
Depth of cut : Fixed cut area
Pass : 6 times
Coolant : Wet

■A HIGHER LEVEL OF PRECISION THAN CONVENTIONAL INSERTS (G-CLASS GROUND INSERTS)



High precision threading can be achieved by using MMT inserts that feature a ground rake face and peripheral cutting edge.

Thread Type	Threading Tolerance
ISO Metric 60°	6g / 6H
American UN 60°	2A / 2B
Whitworth 55° for BSW, BSP	Medium Class A
BSPT 55°	Standard BSPT
Round DIN 405 30°	7h / 7H

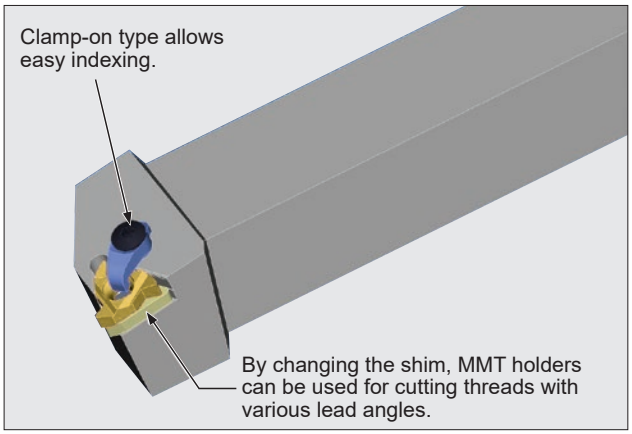
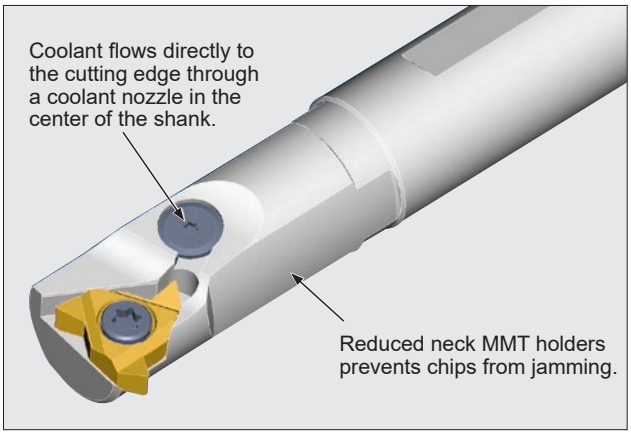
API Round 60° Casing & Tubing 60°	Standard API RD
American NPT 60°	Standard NPT
American NPTF 60°	Class2

■HOLDER (Use of special surface treatment)

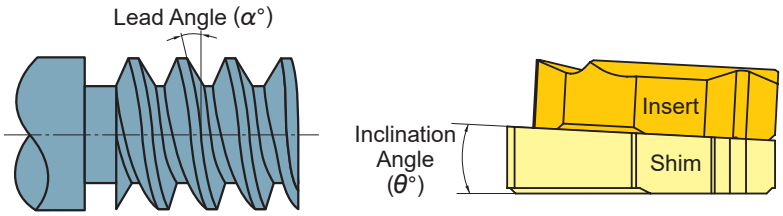
External



Internal



■SUITABLE FOR THREADING WITH A LARGE LEAD ANGLE



By changing only the shim, MMT holders can be used for turning of threads with various lead angles as well as the turning of left hand threads.

Lead Angle (α°)	Inclination Angle (θ°)
−1.5°	−3°
−0.5°	−2°
0.5°	−1°
1.5°	0°
2.5°	1°
3.5°	2°
4.5°	3°

Standard shim delivered with the holder.

■GRADE

VP10MF (G-class ground insert only)

●Superior wear and plastic deformation resistance

- High wear and plastic deformation resistance for threading when maintaining the thread form is important. Suitable for continuous high precision machining with extensive tool life.
- Effective in combination with G-class inserts for high precision threading.

VP15TF (G-class ground insert, M-class insert with 3-D chip breakers)

●Wide versatility

- High fracture resistance during low rigidity applications such as bar feed machining. Able to withstand harsh conditions for long periods where conventional inserts would be liable to breakage.
- Effective combination of high cost performance M-class inserts with 3-D chip breakers.

VP20RT (M-class insert with 3-D chip breakers)

●Excellent fracture resistance

- Suitable for stainless steel boring and unstable machining where inserts are vulnerable to fracturing.
- Effective combination of high cost performance M-class inserts with 3-D chip breakers.

■CHOOSING M-CLASS INSERTS WITH 3-D CHIP BREAKERS OR G-CLASS INSERTS

Insert	Chip control	Precision of thread
M-class inserts with 3-D chip breakers 	◎	○

Insert	Chip control	Precision of thread
G-class inserts 	○	◎

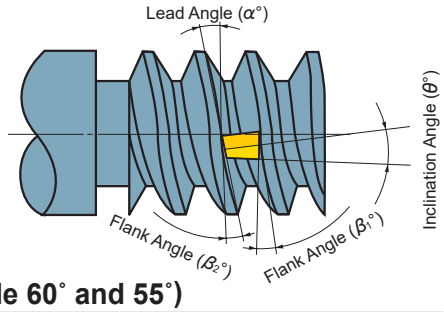
- For ideal chip control and a high cost performance ratio, M-class inserts with 3-D chip breakers are recommended.
- G-class inserts are recommended where higher precision is required.

CUTTING CONDITIONS OF MMT SERIES

SELECTING A SHIM FOR THE MMT SERIES

■FLANK ANGLE AND LEAD ANGLE

Lead angle (α) depends on a combination of thread diameter and pitch. Select a shim so that the lead angle of the thread can coincide with the flank angles of the thread and insert (β_1, β_2). No need to change a shim for general threading with an MMT holder. When threading with a small diameter or large pitch, change the shim depending on the lead angle, referring to the table and graph below. When threading left hand threads, change to a shim with a negative inclination angle.



■SHIM REFERENCE TABLE (THREADING DIAMETER) (Thread angle 60˚ and 55˚)

Lead Angle / Pitch (mm)	Right Hand Thread (mm)						Left Hand Thread (mm) *

* Back turning in the case of left hand threads.

When replacing a shim, check if the difference between the thread lead angle and shim inclination angle is within:
2.5°−0.5° where thread helix angle is 60° (55°)
2°−1° where thread helix angle is 30° (29°)
∗ Inclination angle of a standard shim is 0°.
∗ The holder has a 1.5° lead angle.

■ CALCULATION OF THREAD LEAD ANGLE

$$\tan\alpha = \frac{l}{\pi d} = \frac{nP}{\pi d}$$

α: Lead angle
l : Lead
n : Number of threads
P : Pitch
d : Effective diameter of thread

■ EXAMPLE OF SELECTING A SHIM

• When the thread lead angle is 2.2°
①In the case when the thread helix angle is 60°
(2.2° lead angle) − (2.5°−0.5°) = -0.3°−1.7° shim inclination angle is appropriate.
Threading with a standard shim (0° inclination angle) is possible. But, replacing with a shim with a 1° inclination angle is recommended, refer to Standard Shim List on pages G021 and G026.
②In the case when the thread helix angle is 30°
(2.2° lead angle) − (2°−1°) = -0.2°−1.2° shim inclination angle is appropriate.
Replacing with a shim with a 1° inclination angle is recommended, referring to Standard Shim List on pages G021 and G026.

■ RELIEF ANGLE OF AN INSERT SET ON A HOLDER

Thread Helix Angle	Internal Relief Angle	External Relief Angle
60°	8.8°	5.8°
55°	7.9°	5.2°
30°	4.1°	2.7°
29°	4°	2.6°

• Relief angles (β_2, β_1) of an insert become small when the thread helix angle of a trapezoidal, round, or other thread is small. Take care when selecting a shim.

Note 1) · Set the finishing allowance on a diameter at approx. .004 inch when using a full form insert.
· Please note the cutting depth and the number of passes when a nose radius of a partial or semi-full form insert or of an internal threading insert is small to prevent damage to the insert nose.
· Please set the cutting depth sufficiently deep enough on materials such as hardened steel or austenitic stainless steel to help prevent premature wear and chipping caused by the outer layer of the material.

Note 1) · Set the finishing allowance on a diameter at approx. .004 inch when using a full form insert.
· Please note the cutting depth and the number of passes when a nose radius of a partial or semi-full form insert or of an internal threading insert is small to prevent damage to the insert nose.
· Please set the cutting depth sufficiently deep enough on materials such as hardened steel or austenitic stainless steel to help prevent premature wear and chipping caused by the outer layer of the material.

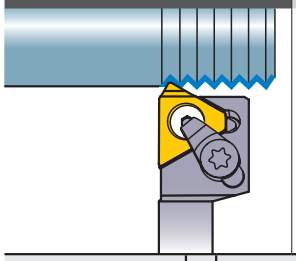
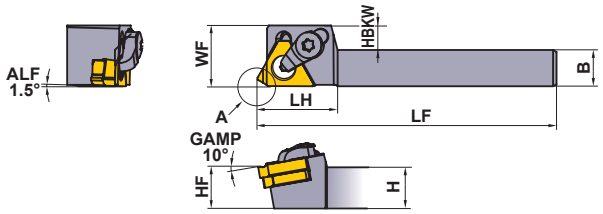
MMTE HOLDER

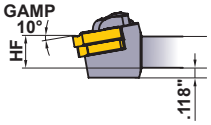
- Various insert types.
- Precision class insert for precise thread forms.
- Available with a pressed breaker for chip control.
- Able to change lead angle by replacing the shim.

MMTE — External threading





Details of position A
Refer to the insert standards for dimensions PDX and PDY.



MMTER-063SM

Right hand tool holder only.

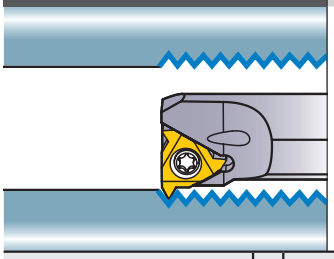
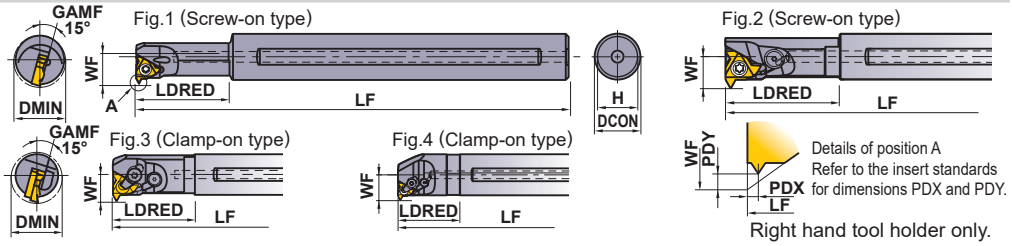
MMTI TYPE BORING BARS

- Minimum cutting diameter .500".
- Various insert types.
- Precision class insert for precise thread forms.
- Available with a pressed breaker for chip control.
- Able to change lead angle by replacing the shim.

MMTI

Internal threading





Right hand tool holder only.

Note 1) Select and use an alternate shim from list below (sold separately), dependant on the lead angle.
- The screw-on type has no shim. The holder has an in-built lead angle. Please select a holder with the appropriate lead angle.
- The minimum cutting diameter (DMIN) indicates the prepared hole diameter, not the nominal thread diameter.

* Clamp Torque (lbf-in) : TS25=8.9, CS350860T=31, SETS51=31, TS43=31, SETS61=44, HFC03006=13, HFC04008=19

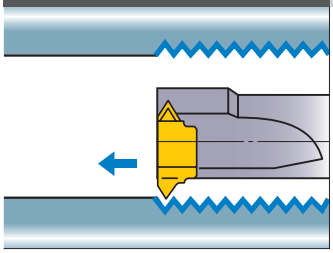
CUTTING DEPTH GUIDE ➤ G017

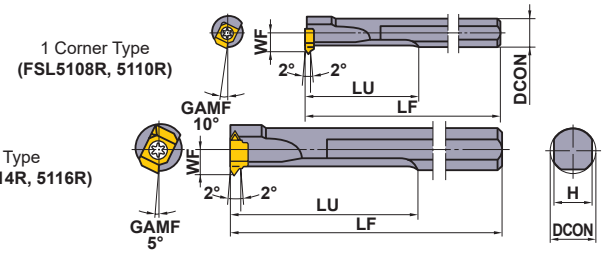
F TYPE BORING BARS

- Minimum cutting diameter 10 mm.
- Screw-on type.
- Applicable to threading, grooving.
- Thread pitch 1.5—3.5 mm.

FSL51 Internal threading, Grooving



Note 1) Cutting in the opposite direction is not possible.



Right hand tool holder only.

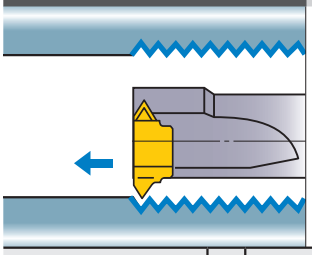
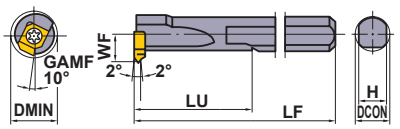
F TYPE BORING BARS

- Min. cutting diameter .390 inch.
- Screw-on type.
- Usable for various applications.
- Max. groove depth: .118 inch.

S-SL5N — Internal threading, Grooving



1 Corner type (S-SL5NR05 / 06)



2 Corner type (S-SL5NR08 / 10 / 12)
