Tooling system
for turning on
multi-task machines

HSK-T TOOLS

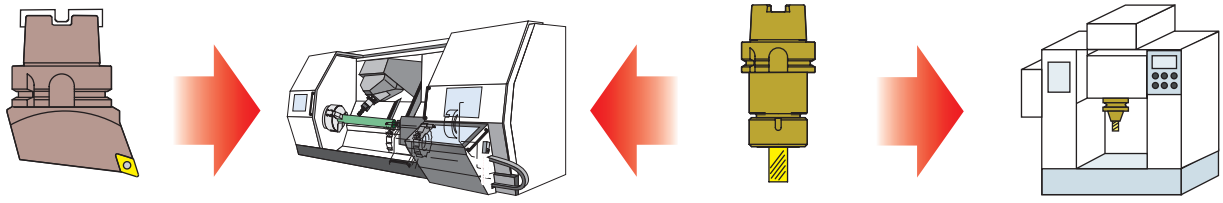
HSK-T System

HSK-T is a new HSK system designed for turning on multi-task machines that are compatible with HSK-A type (ISO standard: ISO12164-1:2001).
The HSK system was developed by a consortium of 17 Japanese manufacturers and registered in ISO standard (ISO12164-3:2008) under the name HSK-T type in 2008 and JIS standard (JIS B6064-3) in 2013.

High accuracy cutting edge positioning

The HSK-T type has a closer tolerance between the spindle key and tool holder keyway than the HSK-A type. This results in higher cutting edge positional accuracies. For milling, the conventional HSK-A type tools can be still used.

Compatible with both multi-task machines and machining centers



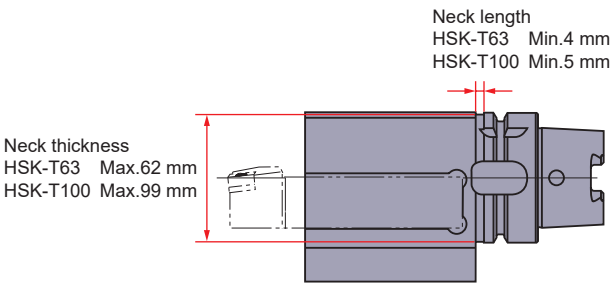
HSK-T
Turning tool holder

HSK-T spindle
Multi-task machines

HSK-A
Rotating tool holder

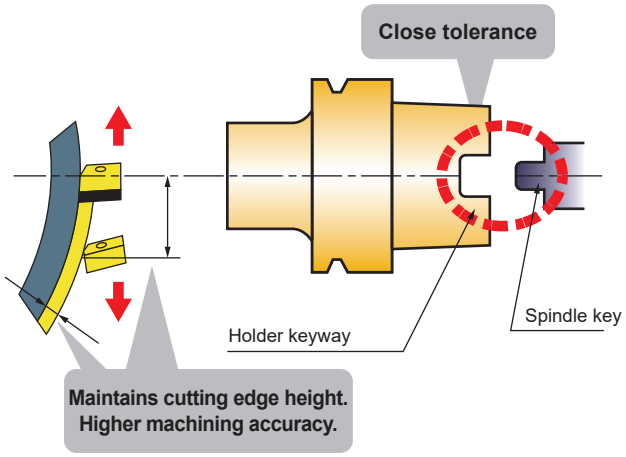
HSK-A spindle
Machining center

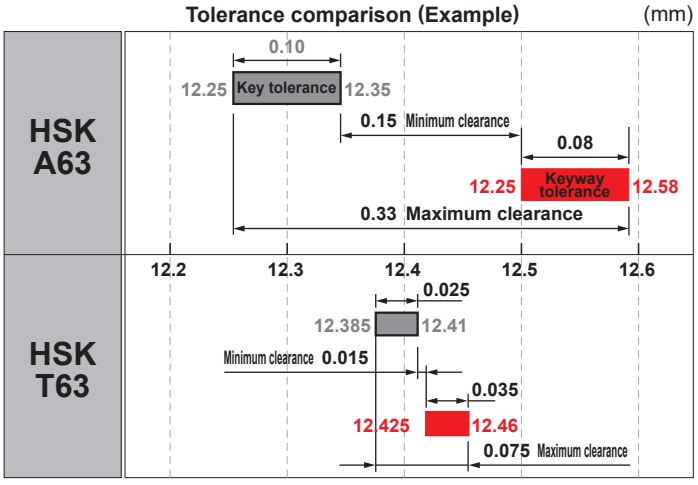
*Note
Short neck length from the flange with thick body of the HSK-T turning tool as shown in the figure at the left.
Because there are machines which cannot be mounted depending on the ATC specifications of the multi-task machine (HSK-A type), please check beforehand.
Also be careful of interference of the magazine with adjacent tools.



HSK-T turning tool standard (Example)

Improved keyway tolerance



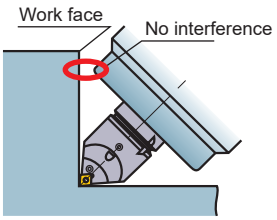


High accuracy and rigidity HSK-T type tooling system developed for use on multi-task machines.

Straight type tools suitable for use on multi-task machines

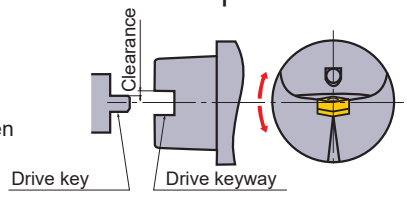
Avoid workpiece interference with improved tool accessibility.

By tilting the machines B spindle (main axis of the tool) at 45 degrees, interference between the spindle, holder, workpiece and chuck can be avoided.



Improve centering height by positioning the cutting edge at the center of the spindle.

Increased stability and accuracy can be achieved because the cutting edge centering height is not affected by the gap between the spindle and the key.



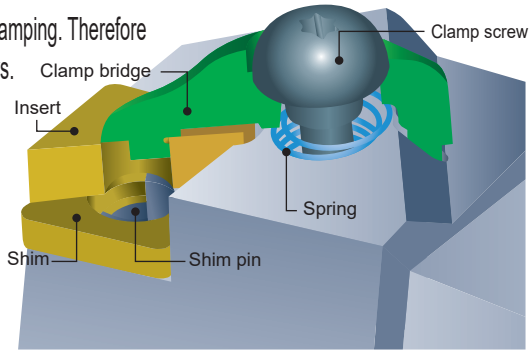
New single-action double clamp series

The double clamp mechanism offers high rigidity, accuracy and reliability that ensures secure insert clamping. Therefore making it suitable for turning of difficult to machine materials such as stainless and heat resistant alloys.

Handed type for turning and facing

Straight type for turning and facing

For turning, facing and boring



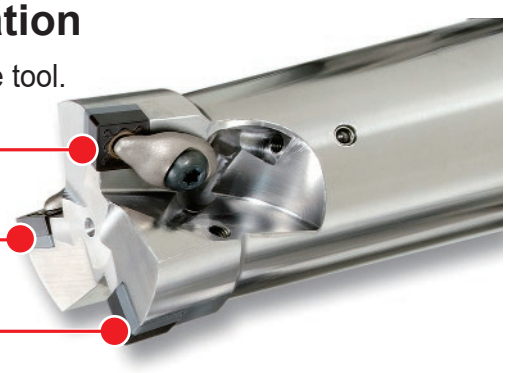
3 on 1 tool for process and tool consolidation

3 turning inserts of the same geometry can be installed on a single tool.

The same type of inserts can be installed for quick change with spare tools.

Different types of inserts can be installed for different applications (roughing, semi finishing and finishing)

Inserts in different grade types can be installed to cover various kinds of workpieces.



New HSK-T100 size for large workpieces

Larger tool holder sizes for high efficiency machining.

Square shank holder type

Boring bar / Drill type

Sleeve

A single tool can be used with different sized tool holders.

- Available for use with JIS B4126 (ISO 5610) 32x32 and 32x25 tools.
- Possible to fit a 25x25 tool by using a 7 mm plate.
  Possible to fit a 1"x1" tool by using a 6.6 mm plate.

*Please prepare a plate on your own.

Note 1) The first pass causes a high load on the cutting edge.
In order to avoid damage, keep the depth of cut to 0.4−0.5 mm maximum.

ORDER NUMBER OF END MILLS

VQ 4 S VB R0100 *

End Mill Names

- **VQ** : SMART MIRACLE end mills
- **VQT** : SMART MIRACLE end mills focused on machining Ti-alloys
- **VQN** : SMART MIRACLE end mills focused on machining Ni-based alloys
- **VFR** : IMPACT MIRACLE REVOLUTION end mills
- **VF** : IMPACT MIRACLE end mills
- **MP** : MS plus end mills
- **MS** : Mstar end mills
- **VC** : Miracle end mills
- **DLC** : DLC coated end mills
- **A** : ALIMASTER end mills
- **DFC** : CVD diamond coated end mills
- **DF** : Diamond coated end mills
- **DC** : Diamond coated end mills
- **CE** : Ceramic end mills
- **C** : Carbide end mills

Number of Flutes

- **1** : 1flute
- **2** : 2flute
- **3** : 3flute
- **4** : 4flute
- **5** : 5flute
- **6** : 6flute
- **8** : 8flute
- • • •

Flute Length

- **ES** : Extra short
- **S** : Short
- **M** : Medium
- **J** : Semi long
- **L** : Long
- **XL** : Long neck
- **X** : Taper neck

Features

- **S** : General use
- **U** : For stainless steel
- **K** : For keyway
- **A** : For light alloy
- **C** : Center cut, chamfering
- **D** : For deep cut
- **V** : Irregular spiral helix angle
- **B** : Ball nose
- **VB** : Irregular spiral helix angle, Ball nose
- **R** : Roughing
- **FPR** : Fine roughing
- **H** : High helix
- **T** : Taper
- **TB** : Taper ball nose
- **WB** : Wide ball nose
- **RB** : Corner radius
- **FDRB** : Duplex corner radius
- **CH** : Coolant holes (side)
- **OH** : Coolant holes (end)
- **UR** : Multi step radius
- **Z** : Drilling

Dimensions

- **D✱✱✱✱** : Diameter

ex.

D0050 →ϕ0.5

D0500 →ϕ5

- **R✱✱✱✱** : Radius of ball nose

ex.

R0050 → R0.5

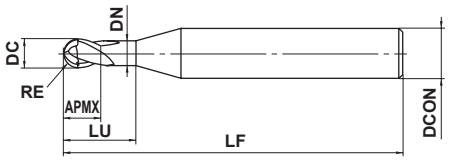
R0500 → R5

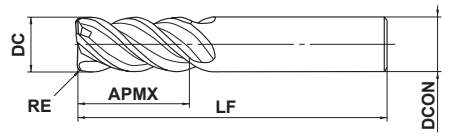
Others

- **S✱✱** : Shank diameter
- **N✱✱✱** : Neck length
- **T✱✱✱✱** : Taper angle one side
- **L✱✱** : Flute length
- **A✱✱✱** : Overall Length
- **C** : Coolant holes (center)

✱Other types are available by special order.

GUIDE FOR ISO13399 SYMBOLS





Symbol	Content
APMX	Depth of cut maximum
DC	Cutting diameter
DN	Neck diameter
LF	Functional length
LU	Usable length
RE	Corner radius

✱There are exceptions other than those listed above. For more details, please refer to the technical data (page N002).

SYMBOL DESCRIPTIONS

Tool Material

Ultra Micro Grain Carbide
Ultra micro grain carbide is used as the substrate material.

Cubic Boron Nitride
Mitsubishi's original CBN is used.

Ceramic
Ceramic is used as the substrate material.

Tolerances

Outside Diameter Tolerance
Indicates diameter tolerance of end mill.

R Tolerance
Indicates the radial tolerance of a ball nose end mill.

R Tolerance
Indicates the radial tolerance of an end mill with a corner radius.

Tolerance of Taper Angle
Indicates the tolerance of the taper angle.

Tolerance of Point Angle
Indicates the tolerance of the point angle.

Shank Diameter Tolerance
Indicates the shank diameter tolerance of end mill.

Angle, Coolant hole, Sharp corner edge and Gash land

Helix Angle
Indicates the helix angle of the end mill.

End Cutting Edge with Coolant Hole

Peripheral Cutting Edge with Coolant Hole

Sharp Corner Edge
Indicates the end mill has a sharp corner edge.

Gash Land
Indicates the end mill cutting edge has a gash land.

Series

SMART MIRACLE End Mills
(Al, Cr)N coaitng optimum for difficult-to-cut materials.

SMART MIRACLE End Mills
(Al, Cr)N coating optimum for Ti-alloys.

SMART MIRACLE End Mills
(Al, Ti, Si)N coating optimum for Ni-based alloys.

IMPACT MIRACLE REVOLUTION End Mills
A coating which adds the excellent high oxidation temperature of (AL, Cr, Si) N-based films to the nano crystal technology of VF.

IMPACT MIRACLE End Mills
Single phase nano crystal coating technology for higher film hardness and heat resistance.

MS PLUS End Mills
Offers higher versatility for carbon steel, alloy steel and hardened steel.

MS End Mills
PVD offers higher versatility.

MIRACLE End Mills
The original Miracle (Al, Ti)N coating also suitable for dry cutting of carbon steels and hardened steels.

DLC Coated End Mills
Hardness similar to that of CVD diamond coating achieved with high adhesion strength.
(Jointly developed with SHINMAYWA INDUSTRIES, LTD.)

CVD Diamond Coated End Mills
Suitable for CFRP

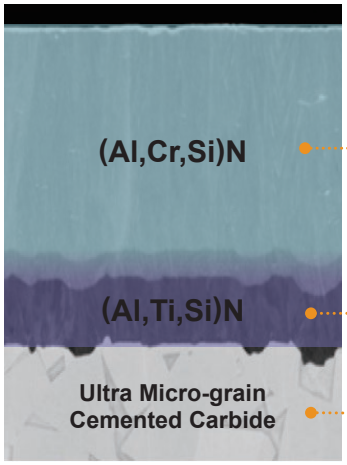
CVD Diamond Coated End Mills
High performance coating for hard brittle materials excelling in film adhesion to the substrate.

DF End Mills
Suitable for graphite machining.

COATING TECHNOLOGY

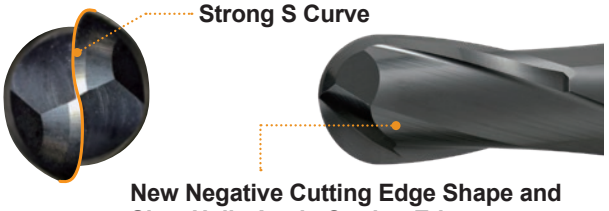
VFR

The combination of the (Al, Cr, Si) N coating (newly-developed), which has a high oxidation temperature and high lubricity, together with the (Al, Ti, Si) N coating, which has better wear resistance and high adhesion, allows hardened steel with even greater strength to be maintained.



★High Oxidation Temperature
★High Lubricity

★Better Wear Resistance
★High Adhesion



Strong S Curve

New Negative Cutting Edge Shape and Slow Helix Angle Cutting Edge

New ZERO-μ Surface
Newly-developed Surface Reforming Technology

New Ball Geometry for Mirror Finish Cutting

VF

For higher hardness, higher speed and longer tool life!

In comparison with the conventional coating single-phase nano crystal coating technology offers higher coating hardness and heat resistance. When machining hardened steels it can be seen that the IMPACT MIRACLE coating offers a lower friction of coefficient and as such prevents abnormal damage such as chipping.

Properties of IMPACT MIRACLE End Mills

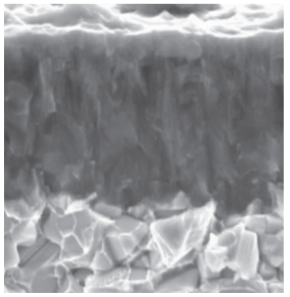
	ÍMPACT MIRACLE Single-phase nano coating (Al,Ti,Si)N	(Al,Ti,Si)N	(Al,Ti)N
Hardness (HV)	**3700**	3200	2800
Oxidation Temperature (°F)	**2370**	2010	1540
Adhesion (N)[1)]	**100**	80	80
Wear Coefficient[2)]	**0.48**	0.53	0.58

1) Adhesion : Measured by critical load scratch test.
2) Coefficient of friction : Measured by ball-on-disk method.
(Counter gear : AISI D2 60HRC)

MS+

Suitable coating for a broad range of workpiece materials such as carbon steel, alloy steel and hardened steel of approx. 50HRC.

Our original coating technology enables a multilayer of (Al,Ti)N and (Al,Cr)N. It allows machining of a wide range of workpiece materials.

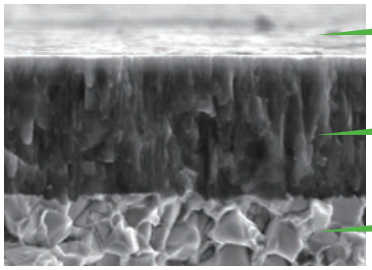


Properties of MS plus End Mills

	(Al,Ti,Cr)N multilayer	(Al,Ti)N	(Al,Cr)N
Hardness (HV)	**3200**	2800	3100
Oxidation Temperature (°F)	**2012**	1472	2012
Adhesion (N)	**100**	80	80

VQ VQT

Newly-developed (Al,Cr)N coating with improved wear resistance.
The smoothening treatment of the coating layer reduces the cutting resistance and improves chip discharge significantly. This next-generation coating offers longer tool life and higher efficiency in machining difficult-to-cut materials.



SMART MIRACLE Coating

ZERO- μ Surface

The original surface treatment technology offers smooth coating layer. A good balance of smooth surface and sharp edge allows smooth chip discharge and reduces the cutting resistance. Machining efficiency and tool life is improved.

VQN

The (Al, Ti, Si)N based coatings maintain their film hardness and heat resistant properties under the harshest of conditions, making it highly suitable for applying to end mills for machining heat resistant super alloys.

DLC

Newly developed DLC coating.
Hardness similar to that of CVD diamond coating achieved with high adhesion strength.

Mitsubishi Materials and SHINMAYWA INDUSTRIES, LTD. have jointly developed a unique DLC coating that has substantially increased "adhesion strength" compared to previous DLC coating.

DC

Proprietary CVD diamond coating produces excellent wear resistance and smooth surface finish.

The newly developed CVD diamond coated carbide material achieves outstanding abrasion resistance and smoothness due to a proprietary fine multilayer diamond crystal control technology.
Suitable for cutting hard brittle materials such as cemented carbide.

DF

Diamond coating for non-ferrous and new non-metal materials.

Owing to Mitsubishi's unique plasma chemical vapor deposition (CVD) coating technology, great combination of coating hardness similar to that of natural diamond has been combined with a good adhesion to carbide substrates.
DF end mill series suitable for graphite machining.

VC

MIRACLE coating for high speed milling.

Miracle coating is produced by adding Al to the existing TiN coating.
This coating layer consists of a compound solid solution of (Al,Ti)N.
This results in improving the heat resistance during cutting, and thus delivers high performance in high hardness material machining and high speed dry cutting. It also has the high adhesion strength for the cemented carbide substrate, and extends the tool life significantly compared to conventional products.

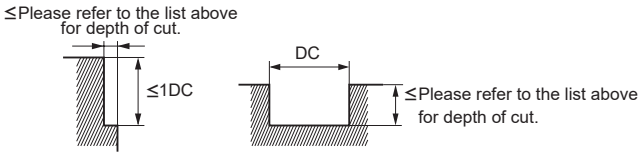
Depth of cut



DC:Dia.

Note 1) If the depth of cut is smaller than this table, feed rate can be increased.
Note 2) In case of slotting with over 3 mm endmill, please reduce revolution to 50—70% of above value, and reduce feed rate to 40—60% of above value.
Note 3) When drilling, please set the feed rate at 1/3 or below of the above value.
Note 4) If the rigidity of the machine or the workpiece material installation is very low, or chattering is generated, please reduce the revolution and the feed rate proportionately.

Depth of cut

( ) : Indicates standard revolution and feed rate in slotting.

DC:Dia.

Note 1) When cutting austenitic stainless steel, the use of water-soluble cutting fluid is especially effective.
Note 2) If the depth of cut is smaller than this table, feed rate can be increased.
Note 3) When drilling, please set the feed rate at 1/3 or below of the above value.
Note 4) If the rigidity of the machine or the workpiece material installation is very low, or chattering is generated, please reduce the revolution and the feed rate proportionately.

Depth of cut

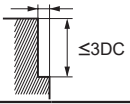
≤Please refer to the list above for depth of cut.



DC:Dia.

Note 1) If the depth of cut is smaller than this table, feed rate can be increased.
Note 2) When drilling, please set the feed rate at 1/3 or below of the above value.
Note 3) If the rigidity of the machine or the workpiece material installation is very low, or chattering is generated, please reduce the revolution and the feed rate proportionately.

MS2XL

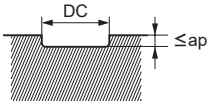
Depth of cut



DC:Dia.

Note 1) If the depth of cut is smaller than this table, feed rate can be increased.
Note 2) Cutting conditions may differ considerably due to the overhang, depth of cut, and machine tool conditions. Please use the above table as a start reference point.

Depth of cut															

DC:Dia.

Note 1) When cutting austenitic stainless steel, the use of water-soluble cutting fluid is especially effective.
Note 2) If the depth of cut is smaller than this table, feed rate can be increased.
Note 3) If the rigidity of the machine or the workpiece material installation is very low, or chattering is generated, please reduce the revolution and the feed rate proportionately.

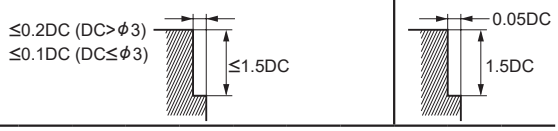
Depth of cut												



DC:Dia.

Note 1) When cutting austenitic stainless steel, the use of water-soluble cutting fluid is especially effective.
Note 2) If the depth of cut is smaller than this table, feed rate can be increased.
Note 3) When drilling, please set the feed rate at 1/3 or below of the above value.
Note 4) If the rigidity of the machine or the workpiece material installation is very low, or chattering is generated, please reduce the revolution and the feed rate proportionately.

Depth of cut												

DC:Dia.

Note 1) When cutting austenitic stainless steel, the use of water-soluble cutting fluid is especially effective.
Note 2) If the depth of cut is smaller than this table, feed rate can be increased.
Note 3) When drilling, please set the feed rate at 1/3 or below of the above value.
Note 4) If the rigidity of the machine or the workpiece material installation is very low, or chattering is generated, please reduce the revolution and the feed rate proportionately.

Depth of cut

DC:Dia.

Note 1) If the depth of cut is smaller than this table, feed rate can be increased.
Note 2) In case of slotting with over 3 mm endmill, please reduce revolution to 50—70% of above value, and reduce feed rate to 40—60% of above value.
Note 3) When drilling, please set the feed rate at 1/3 or below of the above value.
Note 4) If the rigidity of the machine or the workpiece material installation is very low, or chattering is generated, please reduce the revolution and the feed rate proportionately.

Depth of cut	 											

DC:Dia.

Note 1) When cutting austenitic stainless steel, the use of water-soluble cutting fluid is especially effective.
Note 2) If the depth of cut is smaller than this table, feed rate can be increased.
Note 3) When drilling, please set the feed rate at 1/3 or below of the above value.
Note 4) If the rigidity of the machine or the workpiece material installation is very low, or chattering is generated, please reduce the revolution and the feed rate proportionately.

Depth of Cut												

DC : Dia.

Note 1) When cutting austenitic stainless steel, the use of water-soluble cutting fluid is especially effective.
Note 2) If the depth of cut is smaller than this table, feed rate can be increased.
Note 3) If the rigidity of the machine or the workpiece material installation is very low, or chattering and noise are generated, please reduce the revolution and the feed rate proportionately.

Depth of Cut												

Note 1) α is the inclination angle of the machined surface.
Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.
Note 3) If the rigidity of the machine or the workpiece material installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

Depth of Cut	≤ae, ≤ap											

Note 1) α is the inclination angle of the machined surface.
Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.
Note 3) If the rigidity of the machine or the workpiece material installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

Depth of Cut

RE : Radius

Note 1) When the inclination angle of machined surface is high, or when machining at high loads; such as in corners, reduce the revolution and feed rate.
Note 2) The use of oil mist is recommended when machining with small diameter.
Note 3) The revolution and feed rate can be increased at small depths of cut (ap).

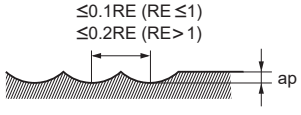
Depth of Cut



RE : Radius

Note 4) Cutting conditions may differ considerably due to the overhang, depth of cut and machine tool condition. Please use the table above as a reference starting point.
Note 5) For hardened steel over 55 HRC, use VF2XLB.
Note 6) For cutting conditions for austenitic stainless steel and titanium alloy, use the high hardness steel (45-55 HRC) table but reduce the spindle speed by 40% and the feed rate by 55%.

MP2XLB

Ball nose, Short cut length, 2 flute, Long neck

Depth of Cut									

Note 1) When cutting austenitic stainless steels, the use of water-soluble cutting fluid is effective.
Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.
Note 3) When drilling, please set the feed rate at 1/3 or below the values above.
Note 4) If the rigidity of the machine or the workpiece material installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

Depth of Cut							

DC:Dia.

Note 1) When cutting austenitic stainless steels, the use of water-soluble cutting fluid is effective.
Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.
Note 3) When drilling, please set the feed rate at 1/3 or below the values above.
Note 4) If the rigidity of the machine or the workpiece material installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

DC : Dia.

Note 1) When cutting austenitic stainless steel, the use of water-soluble cutting fluid is especially effective.
Note 2) If the depth of cut is smaller than this table, feed rate can be increased.
Note 3) The above table shows cutting conditions for side milling. For slotting, please reduce the feed rate only to 50% of the table figure. Please set the revolution rate at 60% and the feed rate at 40% when slotting austenitic stainless steel.
Note 4) When drilling, please set the feed rate at 1/3 or below of the above value.
Note 5) If the rigidity of the machine or the workpiece material installation is very low, or chattering is generated, please reduce the revolution and the feed rate proportionately.

Depth of Cut													

Note 1) SMART MIRACLE coating has very low electrical conductivity; therefore, an external contact type of tool setter (electric transmitted) may not work.
When measuring the tool length, please use an internal contact type (non-electricity type) or a laser tool setter.
Note 2) When cutting titanium alloys, the use of water-soluble cutting fluid is effective.
Note 3) If the depth of cut is smaller, the revolution and the feed rate can be increased.
Note 4) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is poor, vibration or abnormal sound can occur.
In this case, please reduce the revolution and the feed rate proportionately, or set a lower depth of cut.

Note 1) SMART MIRACLE coating has very low electrical conductivity; therefore, an electrical contact type of tool setter may not work. When measuring the tool length, please use a mechanical contact type or a laser tool setter.
Note 2) The irregular pitch flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is poor, vibration or abnormal sounds can occur. In that case, please adjust the revolution, feed rate and depth of cut.
Note 3) The revolution and feed rate can be increased with a smaller depth of cut.
Note 4) For stainless steel, titanium alloys and heat resistant alloys, the use of water-soluble coolant is effective.

Depth of cut																				

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, titanium alloy and heat resistant alloy etc. can be achieved with the use of emulsion.
Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient. In these cases the feed and speed should be reduced proportionately.
Note 4) When the depth of cut is smaller than shown the feed rate can be increased.

■Side milling

When machine rigidity, workpiece material rigidity and chip discharge are enough, please select the high efficiency cutting conditions.
When either machine rigidity, workpiece material rigidity or chip discharge are not enough, please select the general-purpose cutting conditions.

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work.
When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, titanium alloy and heat resistant alloy etc. can be achieved with the use of emulsion.
Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient.
In these cases the feed and speed should be reduced proportionately.
Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

VQMHZV

End mill, Medium cut length, 3 flute for drilling and slotting

RECOMMENDED CUTTING CONDITIONS

■Slotting

When machine rigidity, workpiece material rigidity and chip discharge are enough, please select the high efficiency cutting conditions.
When either machine rigidity, workpiece material rigidity or chip discharge are not enough, please select the general-purpose cutting conditions.

Depth of cut																		

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, and titanium alloy can be achieved with the use of water-soluble cutting fluid.
Note 3) Higher feeds and speeds can be used for smaller depth of cut.
Note 4) Vibration can still occur if the machine rigidity and clamping method are insufficient. In these cases the feed and speed should be reduced proportionately.

VQMHZV – Inch sizes

End mill, Medium cut length, 3 flute for drilling and slotting

Hole depth														

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, and titanium alloy can be achieved with the use of water-soluble cutting fluid.
Note 3) Higher feeds and speeds can be used for smaller depth of cut.
Note 4) Vibration can still occur if the machine rigidity and clamping method are insufficient. In these cases the feed and speed should be reduced proportionately.

Depth of cut																				

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, titanium alloy and heat resistant alloy etc. can be achieved with the use of emulsion.
Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient. In these cases the feed and speed should be reduced proportionately.
Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

■ Side milling

When machine rigidity, workpiece material rigidity and chip discharge are enough, please select the high efficiency cutting conditions.
When either machine rigidity, workpiece material rigidity or chip discharge are not enough, please select the general-purpose cutting conditions.

Depth of cut

DC : Dia.

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work.
When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, titanium alloy and heat resistant alloy etc. can be achieved with the use of emulsion.
Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient.
In these cases the feed and speed should be reduced proportionately.
Note 4) When the depth of cut is smaller than shown the feed rate can be increased.

Depth of cut								

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, titanium alloy and heat resistant alloy etc. can be achieved with the use of emulsion.
Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient. In these cases the feed and speed should be reduced proportionately.
Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

Depth of cut

DC : Dia.

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work.
When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, titanium alloy and heat resistant alloy etc. can be achieved with the use of emulsion.
Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient.
In these cases the feed and speed should be reduced proportionately.
Note 4) When the depth of cut is smaller than shown the feed rate can be increased.

Depth of cut																									

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, titanium alloy and heat resistant alloy etc. can be achieved with the use of emulsion.
Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient. In these cases the feed and speed should be reduced proportionately.
Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

1/2	4500	85.0	.75	.025	1000	10.1	.75	.015
Depth of cut								

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, titanium alloy, and heat resistant alloy can be achieved with the use of water-soluble cutting fluid.
Note 3) If the depth of cut is smaller than this table, feed rate can be increased.
Note 4) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is very low, then vibration can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Depth of cut																									

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, titanium alloy and heat resistant alloy etc. can be achieved with the use of emulsion.
Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient. In these cases the feed and speed should be reduced proportionately.
Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

■Slotting

When machine rigidity, workpiece material rigidity and chip discharge are enough, please select the high efficiency cutting conditions.
When either machine rigidity, workpiece material rigidity or chip discharge are not enough, please select the general-purpose cutting conditions.

Note 1) The SMART MIRACLE coating has very low electrical conductivity; therefore, an external contact type of tool setter (electrically transmitted) may not work.
When measuring the tool length, please use an internal contact type (non-electrical type) or a laser tool setter.
Note 2) When cutting titanium alloys, the use of water-soluble cutting fluid is effective.
Note 3) If the depth of cut is shallow, the revolution and the feed rate can be increased.

Depth of Cut													

DC:Dia.

Note 1) SMART MIRACLE coating has very low electrical conductivity; therefore, an external contact type of tool setter (electric transmitted) may not work.
Note 2) When cutting austenitic stainless steels and titanium alloys, the use of water-soluble cutting fluid is effective.
Note 3) If the depth of cut is shallow, the revolution and feed rate can be increased.
Note 4) When drilling, please set the feed rate at 1/3 or below the values above.
Note 5) If the rigidity of the machine or the workpiece material installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

Depth of cut																

RE : Radius

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, titanium alloy and heat resistant alloy etc. can be achieved with the use of emulsion.
Note 3) Chattering can still occur if the machine rigidity and clamping method are insufficient. In these cases the feed and speed should be reduced proportionately.
Note 4) When the depth of cut is smaller than shown the revolution and feed rate can be increased.
Note 5) α is the inclination angle of the machined surface.

RE : Radius

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) When cutting austenitic stainless steel, the use of water-soluble cutting fluid is especially effective.
Note 3) If the depth of cut is smaller than this table, feed rate can be increased.
Note 4) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is very low, then vibration can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.
Note 5) α is the inclination of the machined surface.

Depth of Cut				Max Cut of Depth  ae				Max Cut of Depth  ae			

RE : Radius

Note 1) SMART MIRACLE coating has very low electrical conductivity; therefore, an external contact type of tool setter (electric transmitted) may not work. When measuring the tool length, please use an internal contact type (non-electricity type) or a laser tool setter.

Note 2) If the depth of cut is smaller than this table, feed rate can be increased.

Note 3) If the rigidity of the machine or the workpiece material installation is very low, or chattering is generated, please reduce the revolution and the feed rate proportionately.

Note 4) For sizes RE 0.5, 0.65, 0.9, 1.4, 1.9 and RE 2.4 which have long neck lengths, internal profile milling and round shape slotting are not recommended.

Note 5) Though max ae means stably machinable cutting condition, maximum depth of calculated by effective cutting edge angle is 0.3 times RE. (In that case please reduce the revolution and feed rate than this table.)

Depth of cut											

Note 1) SMART MIRACLE coating has reduced electric conductivity; therefore an external contact type (electric transmitted) tool setter may not work. When measuring the tool length, please use an internal contact type (non-electricity type) tool setter or a laser type tool setter.
Note 2) Effective cutting of stainless steel, titanium alloy and heat resistant alloy etc. can be achieved with the use of emulsion.
Note 3) When the depth of cut is smaller than shown the revolution and feed rate can be increased.

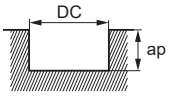
Depth of cut



DC : Dia.

Note 1) When slotting, reduce the revolutions by 50 - 70% and the feed rate by 40 - 60%.
Note 2) For austenitic stainless steel, titanium and heat resistant alloys, VFMHV is recommended.
Note 3) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is very low, then vibration can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

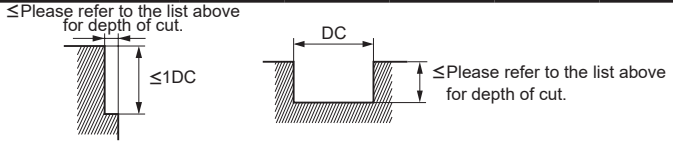
Depth of cut



DC : Dia.

Note 1) When slotting, reduce the revolutions by 50 - 70% and the feed rate by 40 - 60%.
Note 2) For austenitic stainless steel, titanium and heat resistant alloys, VFMHV is recommended.
Note 3) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is very low, then vibration can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

VF6MHV

End mill, Medium cut length, 6 flute, Irregular helix flutes

Carbon Steel, Alloy Steel, Cast Iron (<30HRC)	Tool Steel, Pre-Hardened Steel, Hardened Steel (≤45HRC)	Hardened Steel (≤55HRC)	Hardened Steel (>55HRC)	Austenitic Stainless Steel	Titanium Alloy, Heat Resistant Alloy	Copper Alloy	Aluminum Alloy

Depth of cut									

DC : Dia.

Note 1) When cutting austenitic stainless steel, the use of water-soluble cutting fluid is especially effective.
Note 2) If the depth of cut is smaller than this table, feed rate can be increased.
Note 3) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is very low, then vibration can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Depth of cut	≤0.3DC 0.5DC−1.5DC						≤0.2DC 0.5DC−1.5DC		

DC:Dia.

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.
Note 2) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is poor, vibration or abonrmal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

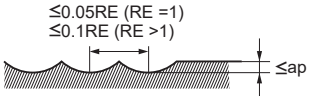
Depth of cut



RE : Radius

Note 1) If the depth of cut is smaller than this table, feed rate can be increased.
Note 2) Cutting conditions may differ considerably due to the overhang, depth of cut, and machine tool conditions. Please use the above table as a start reference point.

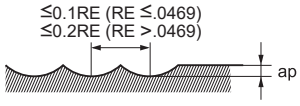
Depth of cut



RE : Radius

Note 1) If the depth of cut is smaller than this table, feed rate can be increased.
Note 2) If the rigidity of the machine or the workpiece material installation is very low, or chattering is generated, please reduce the revolution and the feed rate proportionately.

VF3XB

Ball nose, Medium cut length, 3 flute, Taper neck

Depth of cut	 RE : Radius						

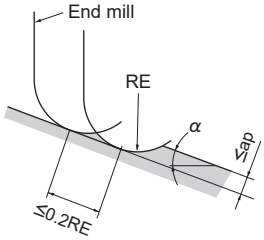
Note 1) α is the inclination of the machined surface.
Note 2) If the depth of cut is smaller than this table, feed rate can be increased.
Note 3) If the rigidity of the machine or the workpiece material installation is very low, or chattering is generated, please reduce the revolution and the feed rate proportionately.



VFFDRB

Multi-task corner radius end mill for impact miracle high speed cutting

Carbon Steel, Alloy Steel, Cast Iron (<30HRC)	Tool Steel, Pre-Hardened Steel, Hardened Steel (≤45HRC)	Hardened Steel (≤55HRC)	Hardened Steel (>55HRC)	Austenitic Stainless Steel	Titanium Alloy, Heat Resistant Alloy	Copper Alloy	Aluminum Alloy

Depth of cut

Note 1) If the depth of cut is smaller than this table, feed rate can be increased.
Note 2) Using air blow or mist is recommended.

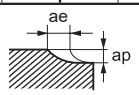
Depth of cut



Note 3) When contour milling, cutting conditions can vary greatly due to the geometry of the workpiece material and depth of cut.
Note 4) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is very low, then vibration can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

VFHVRB

4 flute, Corner radius, Short cut length, Irregular helix flutes

RECOMMENDED CUTTING CONDITIONS

■High depth of cut conditions

Workpiece Material			Carbon steel, Cast iron, Alloy steel (−30HRC) AISI 1050, AISI 35, AISI P20 etc.					Alloy steel, Tool steel, Pre-hardened steel AISI H13, AISI W1−10, AISI P21 etc.					Hardened steel (45−55HRC) AISI H13 etc.					Hardened steel (55−62HRC) AISI D2 etc.				
DC (mm)	RE (mm)	LU (mm)	Revolution (min⁻¹)	Table feed (mm/min)	Table feed (IPM)	Depth of cut ap (mm)	Width of cut ae (mm)	Revolution (min⁻¹)	Table feed (mm/min)	Table feed (IPM)	Depth of cut ap (mm)	Width of cut ae (mm)	Revolution (min⁻¹)	Table feed (mm/min)	Table feed (IPM)	Depth of cut ap (mm)	Width of cut ae (mm)	Revolution (min⁻¹)	Table feed (mm/min)	Table feed (IPM)	Depth of cut ap (mm)	Width of cut ae (mm)

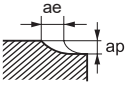
Depth of cut



Note 1) If the depth of cut is smaller than this table, feed rate can be increased.
Note 2) Using air blow or mist is recommended.

Depth of cut																						

Note 3) When contour milling, cutting conditions can vary greatly due to the geometry of the workpiece material and depth of cut.
Note 4) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is very low, then vibration can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

VFHVRB – Inch sizes

Depth of cut																						

Note 1) If the depth of cut is smaller than this table, feed rate can be increased.
Note 2) Using air blow or mist is recommended.
Note 3) When contour milling, cutting conditions can vary greatly due to the geometry of the workpiece material and depth of cut.
Note 4) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is very low, then vibration can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

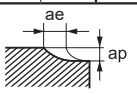
Depth of cut



Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.
Note 2) Air blow or oil mist is recommended for good chip evacuation.
Note 3) For profile machining such as molds, machining conditions may differ considerably depending on the workpiece material geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece material.
Note 4) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is poor, then vibration can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Depth of cut									

DC:Dia.

Note 1) If the depth of cut is shallow, the revolution and feed rate can be increased.
Note 2) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is poor, vibration or abonrmal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

VF6MHVRB

Depth of cut																			

Note 1) If the rigidity of the machine or the workpiece material installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.
Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.
Please reduce the feed rate when the surface finish is important.
Note 3) α is the inclination angle of the machined surface.

Depth of cut													

Note 1) The tools are recommended for use only in finish machining.
Note 2) Air blowing and oil mist are recommended as coolants.
Note 3) Note the following points when using the tools.
- Avoid using equipment abruptly without proper preparation. After sufficiently energizing equipment, ensure that there will be no changes to the depth of cut such as due to elongation of the main axis during machining.
- If the tools are used immediately after rough machining of a surface, large uneven areas (cusp heights) will cause deflection of the tools and waviness of the machined surface. Therefore, it is recommended to add a medium finish machining process which uses the same value of ae as indicated in the table above.

Note 4) α is the inclination angle of the machined surface.

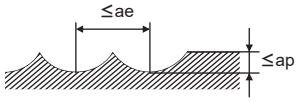
Depth of Cut



Note 1) When the inclination angle of machined surface is large, or machining with large cutting load such as corner area, reduce the revolution and feed rate.

Note 2) If the depth of cut is shallow, the revolution and feed rate can be increased.

Note 3) Cutting conditions may differ considerably due to the tool overhang, depth of cut and machine tool condition. Please use the table above as a reference starting point.

Depth of Cut

Note 1) The cutting conditions above are a guide only to machining with cutting edges with a corner radius. When machining with peripheral cutting edges, use the minimum feed rate as a guide.
Note 2) If depth of cut is shallow, the revolution and feed rate can be increased.
Note 3) For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut, Reduce the feed rate especially when machining the corner sections of workpiece.
Note 4) If the rigidity of the machine or the workpiece installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

VFRPSRB

Corner radius, Short cut length, 4 Flute

RECOMMENDED CUTTING CONDITIONS

ISO13399 ➤ I002

A3SA/A3SARB, DLC3SA/DLC3SARB

Square/Corner radius end mill, Short cut length, 3 flute, with multiple internal thru-coolant holes

RECOMMENDED CUTTING CONDITIONS

Use high efficiency cutting conditions when the machine and workpiece rigidity, and chip evacuation properties are sufficient. Use lower, general-purpose cutting conditions when the mechanical or workpiece rigidity or chip evacuation porperties are insufficient.

High Efficiency Conditions

■Side Milling

Workpiece Material		Aluminum Alloys

Depth of Cut					

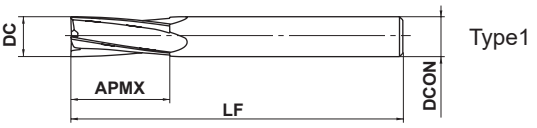
Note 1) It is recommended to use a water-soluble coolant. It is also possible to use air blow (external/internal) for DLC coated types.
Note 2) Climb milling is recommended for side cutting.
Note 3) This table shows the cutting condition with less than 4D overhang length. If more than 4D, spindle speed, feed rate and depth of cut should be reduced.
Note 4) When ramping, consider the chip discharge and use a feed rate 50% lower than the slotting conditions above and also use a ramping angle of 5º or less.
Note 5) If the rigidity of the machine or the workpiece material installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately within the range described in the above table, or reduce the depth and width of cut.

DFC4JC

End mill, 4 flute, For CFRP

CFRP



6≤DC≤12				
0 - 0.03				
DCON=6	8≤DCON≤10	DCON=12		
0 - 0.008	0 - 0.009	0 - 0.011		

● 4 flute end mill with original CVD diamond coating for CFRP machining.

(mm)

Order Number	DC	APMX	LF	DCON	No. of Flutes	Stock	Type
DFC4JCD0600	6	20	70	6	4	●	1

DFC4JCD1000	10	30	90	10	4	●	1
DFC4JCD1200	12	30	100	12	4	●	1

Note 1) Please contact Mitsubishi Materials for geometries and through coolant types that are non-standard.

RECOMMENDED CUTTING CONDITIONS

Workpiece Material	CFRP		
DC (mm)	Revolution (min^{-1})	Table feed (mm/min)	Table feed (IPM)
6	11000	950	37.4
8	8000	780	30.7
10	6400	700	27.6
12	5300	650	25.6

Note 1) Cutting conditions may differ considerably due to the kind of CFRP, the rigidity of the machine, or the clamping and geometry of the workpiece material. Please use the above table as a guideline.
Note 2) When high machining accuracy is needed or if large burrs or delamination occur, we recommend reducing the feed rate.
Note 3) When the depth of cut is greater than 0.8DC, we recommend reducing the feed rate.
Note 4) Please take precautions against dust.

Depth of cut												

Note 1) When high machining accuracy is needed, or the workpiece material becomes chipped, we recommend lowering the feed rate and depth of cut.

Note 2) If the rigidity of the machine or the workpiece material installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

Note 3) When work on dry machining material that contain resin, be careful of tool breakage and mechanical problems (as there is a possibility of blockage caused by cutting chips).

Note 4) Use a milling machine dedicated for graphite.

Depth of cut

Note 1) The cemented carbide in the above mentioned cutting conditions table is based on CIS standard VM-40(90HRA).

Note 2) Air blow or dry processing is recommended with cemented carbide processing.

∗Note: Using coolants or oil mists may decrease tool longevity.

Note 3) The use of a water soluble cutting oil is recommended with the processing of hard brittle materials other than the cemented carbide mentioned in the above table. Be sure to refuel the oil and eliminate any chip discharge that adheres to the tool.

Note 4) Cutting conditions may need adjustments depending on the type of workpiece material.

Note 5) Reduce the rotation speed and feed rate shown in the above table at a similar ratio when no rigidity in the machinery or work mounting and occurrence of chatter or abnormal sound.

Note 6) Implementation of special countermeasures is recommended since fine chip discharge may enter gaps in the processing machinery.

SYMBOL DESCRIPTIONS

Tool Material

Ultra Micro Grain Carbide
Ultra micro grain carbide is used as the substrate material.

Angle, Coolant thru, Sharp corner edge and Gash land

Helix Angle
Indicates the helix angle of the end mill.

End Cutting Edge with Coolant Thru

Peripheral Cutting Edge with Coolant Thru

Gash Land
Indicates the end mill cutting edge has a gash land.

Tolerances

Outside Diameter Tolerance
Indicates diameter tolerance of end mill.

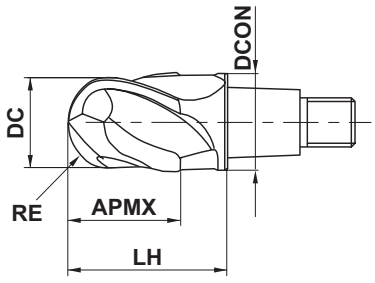
R Tolerance
Indicates the radial tolerance of a ball nose end mill.

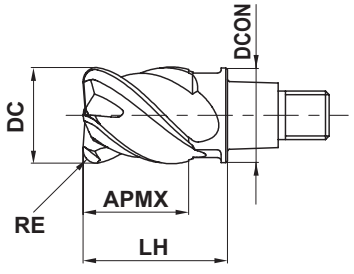
R Tolerance
Indicates the radial tolerance of an end mill with a corner radius.

Tolerance of Point Angle
Indicates the tolerance of the point angle.

Shank Diameter Tolerance
Indicates the shank diameter tolerance of end mill.

GUIDE FOR ISO13399 SYMBOLS





Symbol	Content
APMX	Depth of cut maximum
DC	Dia. (Cutting diameter)
DCON	Connection diameter
LH	Head length
RE	Corner radius

*There are exceptions other than those listed above. For more details, please refer to the technical data (page N002).

CLASSIFICATION

HOLDERS

The undercut type is available in medium, semi-long, and long lengths.

Figure			Length	Taper angle one side	Tool material	Page
Undercut			Medium Semi-long Long	—	Carbide	J078, 079
					Steel	J080, 081
Straight	Straight		Semi-long Long	—	Carbide	J079
	Straight Oversize		Medium	—	Steel	J080, 081
Taper neck			Long	1°	Carbide	J078, 079

CORRECTION FACTOR BY OVERHANG LENGTH (SHOULDER MILLING)

Reduce the cutting parameters by the coefficient values shown according to the length of overhang.
For long edge and oversize type heads refer to their specific recommended conditions.

RECOMMENDED CUTTING CONDITIONS

■ Shoulder Milling (L/D=3)

Other than the L/D = 3, use following recommended cutting conditions by multiplying the J007 page correction factor by overhang length.

Depth of Cut									

Note 1) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is poor, vibration or abnormal sound can occur.
In this case, please reduce the revolution and the feed rate proportionately, or set a lower depth of cut.
Note 2) If the depth of cut is smaller, the revolution and the feed rate can be increased.
Note 3) For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.

Depth of Cut									

Note 1) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is poor, vibration or abnormal sound can occur.
In this case, please reduce the revolution and the feed rate proportionately, or set a lower depth of cut.
Note 2) If the depth of cut is smaller, the revolution and the feed rate can be increased.
Note 3) For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.

Depth of Cut					

Note 1) Vibration may occur if the rigidity of machine or workpiece material is low.
In this case, please reduce the revolution and the feed rate proportionately, or set a lower depth of cut.
Note 2) The use of water-soluble coolant is effective.

Depth of Cut									

Note 1) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is poor, vibration or abnormal sound can occur.
In this case, please reduce the revolution and the feed rate proportionately, or set a lower depth of cut.
Note 2) If the depth of cut is smaller, the revolution and the feed rate can be increased.
Note 3) For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.

Depth of Cut					

Note 1) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is poor, vibration or abnormal sound can occur.
In this case, please reduce the revolution and the feed rate proportionately, or set a lower depth of cut.
Note 2) If the depth of cut is smaller, the revolution and the feed rate can be increased.
Note 3) For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.

Depth of Cut													

Note 1) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is poor, vibration or abnormal sound can occur.
In this case, please reduce the revolution and the feed rate proportionately, or set a lower depth of cut.
Note 2) If the depth of cut is smaller, the revolution and the feed rate can be increased.
Note 3) For profile machining such as molds, machining conditions may differ considerably depending on the workpiece material geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece material.
Note 4) Air blow or oil mist is recommended for good chip evacuation.

Depth of Cut													

Note 1) The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece material installation is poor, vibration or abnormal sound can occur.
In this case, please reduce the revolution and the feed rate proportionately, or set a lower depth of cut.
Note 2) If the depth of cut is smaller, the revolution and the feed rate can be increased.
Note 3) For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.
Note 4) α is the inclination angle of the machined surface.

Depth of Cut									

Note 1) Vibration may occur if the rigidity of machine or workpiece material is low.
In this case, please reduce the revolution and the feed rate proportionately.
Note 2) For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.

Note 1) The fastening size of the holder and head should be the same. (refer to J002)
Note 2) Metric head should be mounted in metric holder.
∗ See page J082 and J083 regarding how to install the head.

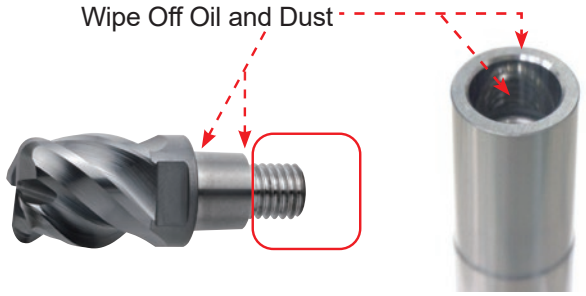
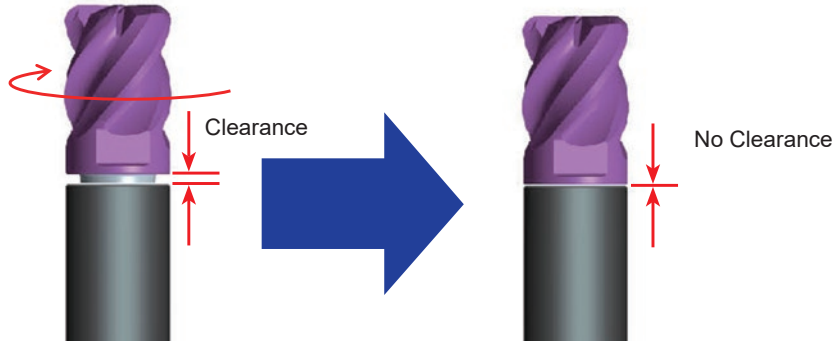
How to Install the Head

1 Using a clean cloth, wipe away oil and dust from the taper and end surfaces of the head and holder.

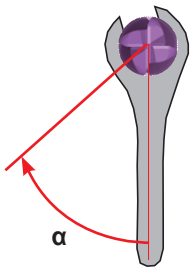


2 Be careful to avoid the possibility of cutting hands when fastening with bare hands directly near the blade tip.
Securely fasten the head and holder end surfaces using the enclosed wrench to close off any remaining gap.



3 Refer to the table at below regarding angles for recommended torque when necessary.
For stricter usage, refer to the table below for torque wrench fastening.

Fastening Size	Reference Tightening Angle α	Recommended Clamping Torque (lbf-in)
IMX10	50°	88
IMX12	50°	132
IMX16	50°	265
IMX20	40°	440
IMX25	35°	660

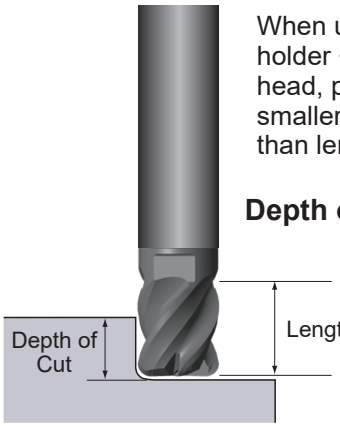


Note 1) Use the enclosed wrench only.
(Typical wrenches differ in thickness.)

How to Select iMX Holders

- When using straight holder + standard head, interference will occur in cases where the depth of cut is larger than the length of cut of the head.
- When using straight holder + oversize head, larger depths of cut are possible because the diameter of the head is larger than the holder.

Straight + Standard Head

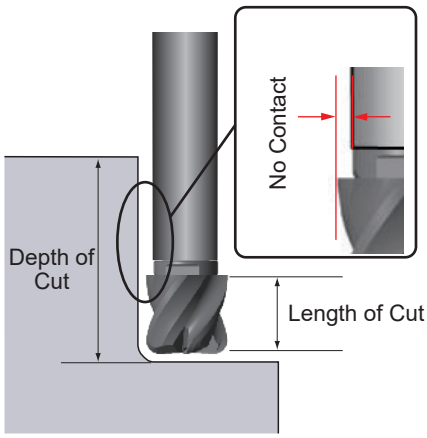


When using straight holder + standard head, please use at smaller depth of cut than length of cut.

Depth of Cut < Length of Cut

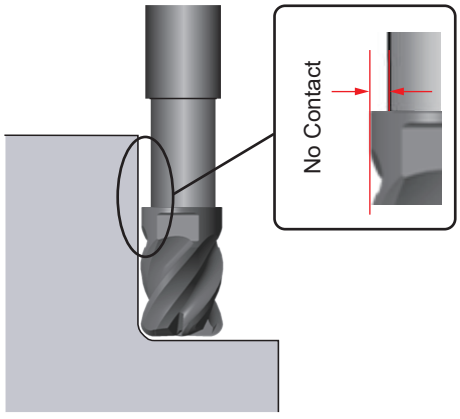
Less than DC x 3 overhang is recommended when depth of cut < length of cut.

Straight + Oversize Head

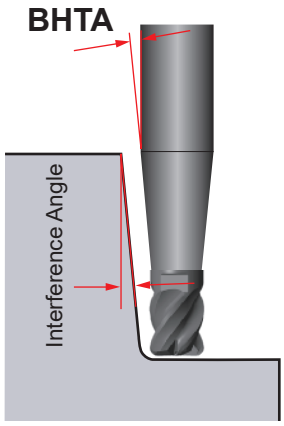


- Undercut type with relieved neck is suitable for vertical wall machining.
- The large diameter of the taper neck holder provides stability in long overhang applications.
- Undercut and taper neck types are now also available. (Please refer to diameter DC of each type for minimum diameter.)

Undercut + Standard Head



Taper Neck + Standard Head



HOW TO READ THE STANDARD OF INDEXABLE MILLING

●How this section page is organized

①Organized according to the face milling cutting mode.
(Refer to the index on the next page.)

SCOPE OF AVAILABLE WORKPIECE MATERIAL
provides a graph depicting the scope of the available workpiece material for machining.

CORNER ANGLE ICON

TYPE/ NAME OF PRODUCT

APPLICATION ICON
represents available machining applications, such as finishing and roughing.

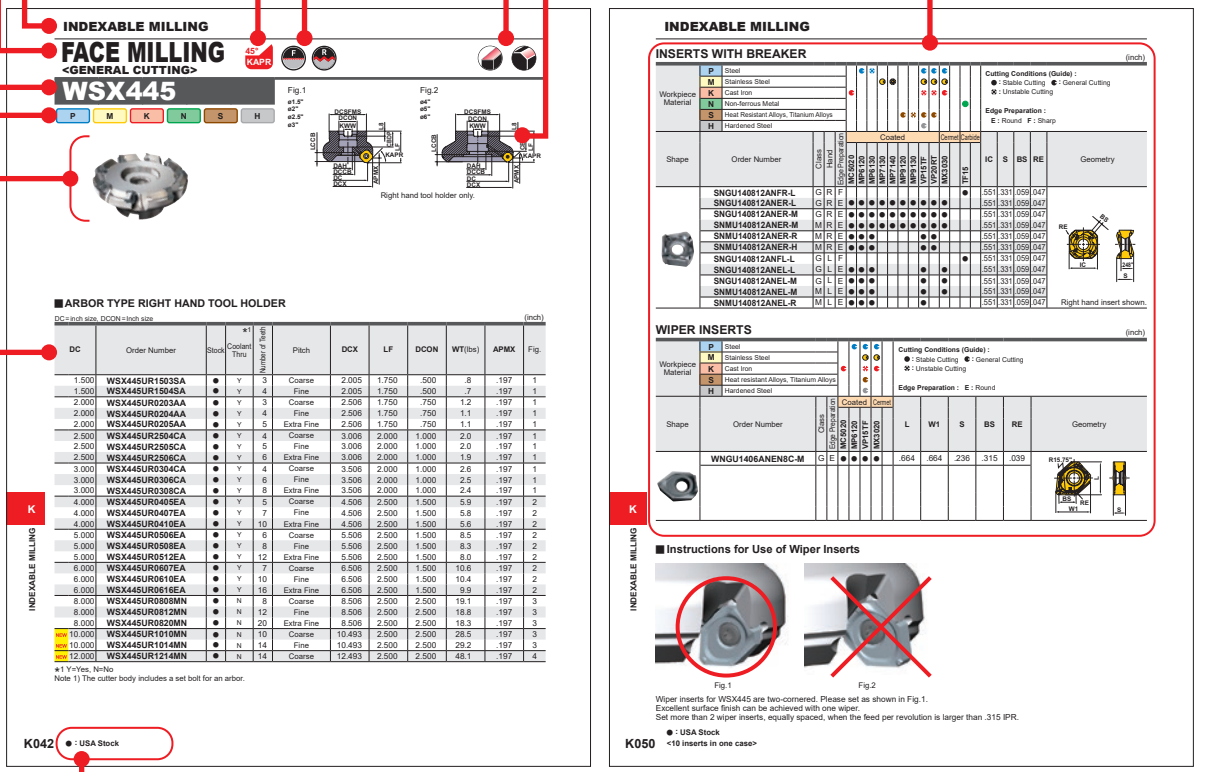
APPLICATION

CUTTING MODE ICON
represents available cutting modes, such as face milling and shoulder milling.

STANDARDS FOR APPLICABLE INSERTS
indicates stock status, dimensions, etc. for applicable inserts.

PRODUCT SECTION

GEOMETRY



LEGEND FOR STOCK STATUS MARK
is shown on the left hand page of each double-page spread.

PRODUCT STANDARDS
indicates tool types, order numbers, stock status (per right/left hand), dimensions, etc.

PHOTO OF PRODUCT

●To Order : For title product, please specify order number and hand of tool (right/left).
For insert, please specify insert number and grade.

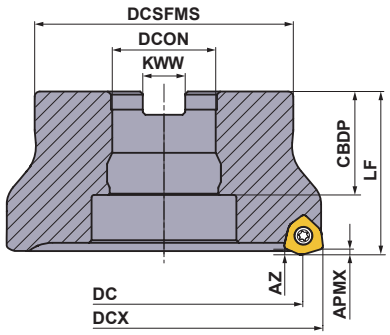
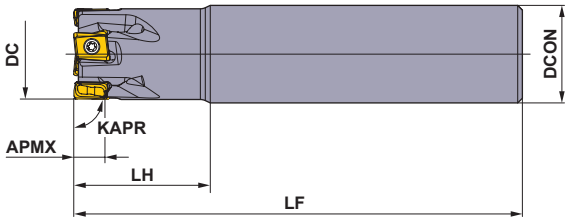
GUIDE FOR ISO13399 SYMBOLS

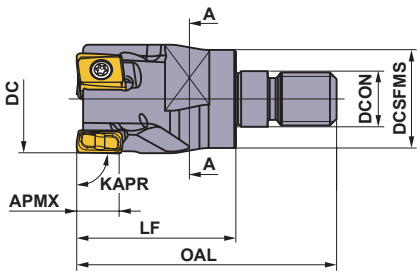
Symbol	Content
APMX	Depth of cut maximum
AZ	Plunge depth maximum
BD	Body diameter
BDX	Body diameter maximum
BS	Wiper edge length
CBDP	Connection bore depth
CRKS	Connection retention knob thread size
CW	Cutting width
DC	Cutting diameter
DCB	Connection bore diameter
DCON	Connection diameter
DCSFMS	Contact surface diameter machine side

Symbol	Content
DCX	Cutting diameter maximum
H	Shank height
KWW	Keyway length
LBX	Body length maximum
LE	Cutting edge effective length
LF	Functional length
LH	Head length
LU	Usable length
OAL	Overall length
RE	Corner radius
RMPX	Ramping angle maximum
WT	Weight of item

*There are exceptions other than those listed above. For more details, please refer to the technical data (page N002).







CLASSIFICATION (ARBOR TYPE)

Product Name · Shape	APMX	Features	Cutter Dia.	Workpiece Material	Page
General Cutting **WSX445** 45° KAPR	.197"	●Double sided Z Geometry. ●Smooth chip discharge.	Ø1.500" | Ø12.000"	P M K N S H	K042
General Cutting **ASX445** 45° KAPR	.236"	●Precision molded 20° positive insert. ●A wide range of chip breakers. ●Screw-on type. ●High rigidity due to employment of a carbide shim.	Ø2.500" | Ø10.000"	P M K N S H	K056
General Cutting **AHX440S** 50° KAPR	.118"	●Heptagonal double sided insert. ●Economical 14 cutting edge inserts. ●Multi insert design for high feed machining.	Ø1.500" | Ø6.000"	P M K H	K062 K064
High Feed Cutting **AHX475S** 15° KAPR	.063"	●For General Cutting. ●Heptagonal double-sided insert. ●Economical 14 cutting edge inserts. ●Multi insert design for high feed machining.	Ø2.000" | Ø6.000"	P K H	K062 K070
General Cutting **AHX640S** 50° KAPR	.236"	●Heptagonal double sided insert. ●Economical 14 cutting edge inserts. ●Multi insert design for high feed machining.	Ø2.500" | Ø8.000"	P M K S H	K062 K074
High Feed Cutting for Cast Iron **AHX640W** 50° KAPR	.236"	●Heptagonal double-sided insert. ●Economical 14 corner use. ●Fine pitch design allows high feed milling.	Ø3.000" | Ø12.000"	K	K086
High Efficiency Cutting for Cast Iron **WSF406W** NEW 84° KAPR	.276"	●Uniquely designed double-sided insert. ●Adjustable cutting edge run-out system. ●Improved surface finish. ●Suppression of edge chipping.	Ø80 mm | Ø250 mm	K	K103
High Efficiency Cutting for Cast Iron **AOX445** 45° KAPR	8 mm	●Octagonal double-sided solid CBN insert. ●Economical 16 corner use. (when depth of cut is 3mm or less) ●High efficiency machining from roughing to finishing. ●Easy operation and cleaning.	Ø63 mm | Ø160 mm	K	K095
High-efficiency Finishing of Aluminum Alloy **FMAX** 90° KAPR	≤.118"	●For high-efficiency finishing of aluminum alloys. ●Feed Maximum (FMAX) milling cutter for ultra efficient and accurate finishing.	Ø40 mm | Ø160 mm Ø3.000" | Ø5.000"	K N	K096

Product Name · Shape	APMX	Features	Cutter Dia.	Workpiece Material	Page
Multi Functional Milling **WJX09** NEW	.047"	●Negative inserts. ●Stable clamp with dovetail structure. ●Suitable for high feed machining. ●Special designed insert with 6 cutting edges. ●Through coolant holes.	1.500" | 2.5000"	P M K S H	K308
Multi Functional Milling **WJX14**	.079"	●Negative inserts. ●Stable clamp with dovetail structure. ●Suitable for high feed machining. ●Special designed insert with 6 cutting edges. ●Through coolant holes.	Ø2.000" | Ø6.000"	P M K S H	K318
Multi Functional Milling **AJX**	.079"	●15° positive insert. ●Air / coolant through. ●High rigidity due to double clamp structure. ●Suitable for high feed cutting. ●Special designed insert with the use of 3 cutting edges.	Ø2.000" | Ø6.299"	P M K S H	K288
Multi Functional Milling of Difficult-to-cut Materials **ARP** R KAPR	.236"	●Air / coolant through. ●Round Insert Cutter for Difficult-to-cut Materials. ●High run-out accuracy when indexing inserts. ●Solid clamping system. ●Standardized stock of extra fine pitch.	Ø1.500" | Ø4.000"	M S	K328
Multi Functional Milling **BRP** R KAPR	.302"	●11° positive insert. ●Round shape insert gives strong cutting edge. ●A wide variety of lengths available. ●Suitable for machining of die and mold.	Ø1.500" | Ø4.000"	P M K S H	K345
For General Cutting **WWX200** NEW 90° KAPR	.197"	●High-stability clamping and high-quality machining. ●The optimized “X-type” insert meets the demand for greater strength. ●Economical double-sided 6 corners.	Ø1.500" | Ø6.000"	P M K S H	K112
For General Cutting **WWX400** NEW 90° KAPR	.323"	●High-stability clamping and high-quality machining. ●The optimized “X-type” insert meets the demand for greater strength. ●Economical double-sided 6 corners.	Ø2.000" | Ø10.000"	P M K N S H	K120
For Cast Iron **VOX400** 90° KAPR	.394"	●Vertical inserts with high strength cutting edge. ●Economical 8 cutting edge inserts. ●Screw-on type.	Ø2.000" | Ø10.000"	K	K106
For General Cutting **ASX400** 90° KAPR	.394"	●Economical due to the use of 4 cutting edges. ●Low resistance due to the 3D design of the curved cutting edge. ●Curved cutting edge and high rigidity holder.	Ø2.000" | Ø10.000"	P M K N S H	K138

CLASSIFICATION (ARBOR TYPE)

Product Name · Shape	APMX	Features	Cutter Dia.	Workpiece Material	Page
Multi Functional Cutting **APX3000** 90° KAPR	.394"	●Air / coolant through. ●Low resistance insert and high rigidity body. ●Ideal chip control. ●High wall accuracy can be produced by using this cutter and unique insert geometry.	Ø1.500" | Ø3.000"	P M K N S H	K156
Multi Functional Cutting **APX4000** 90° KAPR	.591"	●Air / coolant through. ●Low resistance insert and high rigidity body. ●Ideal chip control. ●High wall accuracy can be produced by using this cutter and unique insert geometry.	Ø2.000" | Ø4.000"	P M K S H	K169
Multi Functional Milling **VPX200** 90° KAPR	.315"	●Special designed insert with 4 cutting edges. ●High precision, high quality insert cutting edge with finishing blade. ●Through coolant holes.	Ø1.250" | Ø2.500"	P M K N S H	K184
Multi Functional Milling **VPX300** 90° KAPR	.433"	●Special designed insert with 4 cutting edges. ●High precision, high quality insert cutting edge with finishing blade. ●Through coolant holes.	Ø1.250" | Ø3.000"	P M K N S H	K195
For Aluminum Alloy and Difficult-to-cut Material Cutting **AXD4000** 90° KAPR	.610"	●Air / coolant through. ●Low resistance inserts. ●High balance quality. ●Excellent wall accuracy. ●Multi functional milling.	Ø1.500" | Ø5.000"	P N S	K227
For Aluminum Alloy Material Cutting **AXD4000A** NEW 90° KAPR	.610"	●Air / coolant through. ●Low resistance insert. ●High balance quality. ●Excellent wall accuracy. ●Multi functional milling. ●For ultra-high-speed machining.	Ø2.000"	N	K240
For Aluminum Alloy and Difficult-to-cut Material Cutting **AXD7000** 90° KAPR	.827"	●Air / coolant through. ●Low resistance inserts. ●High balance quality. ●Excellent wall accuracy. ●Multi functional milling.	Ø2.000" | Ø5.000"	P N S	K246
For Aluminum Alloy and Difficult-to-cut Material Cutting **BXD4000** 90° KAPR	.591"	●Air / coolant through. ●Low resistance inserts & high rigidity body. ●The Anti Fly Insert mechanism guarantees secure high-revolution milling.	Ø1.500" | Ø4.000"	P M N S H	K259

CLASSIFICATION (SIDE CUTTER)

Product Name · Shape	APMX	Features	Cutter Dia.	Workpiece Material	Page
VAS400 Side Cutter 90° KAPR	.480"	●Insert with 4 cutting edges secure clamping. ●Excellent sharpness with low cutting resistance insert. ●Holders can load all corner R. ∗Cutter bodies are only available through special orders.	Ø4.000" | Ø8.000"	P K	K144
VAS500 Side Cutter 90° KAPR	.638"	●Insert with 4 cutting edges secure clamping. ●Excellent sharpness with low cutting resistance insert. ●Holders can load all corner R. ∗Cutter bodies are only available through special orders.	Ø100 mm | Ø200 mm	P K	K149
VOS400 Side Cutter 90° KAPR	.394"	●For cast iron. ●Cutter body with high-rigidity design. ●Innovative vertical insert. ●Economical 8 cutting edge insert. ∗Cutter bodies are only available through special orders.	Ø80 mm | Ø160 mm	K	K148
ASX400 Side Cutter 90° KAPR	.394"	●High precision non-grinding insert. ●Economical 4 cutting edge insert. ●Excellent wall surface precision with curved cutting edges and high precision body. ∗Cutter bodies are only available through special orders.	Ø80 mm | Ø160 mm	P M K	K152

CLASSIFICATION (BORE BORING TOOLS)

Product Name · Shape	APMX	Features	Cutter Dia.	Workpiece Material	Page
BMR 35° KAPR	—	●Double positive breaker. ●12-corner type with right hand. ●Body with peripheral cutting edge run-out regulator. ∗Cutter bodies are only available through special orders.	—	K	**K380**

CLASSIFICATION (SHANK TYPE)

Product Name · Shape	APMX	Features	Cutter Dia.	Workpiece Material	Page
WSX445 45° KAPR	.197"	● Double sided Z Geometry. ● Smooth chip discharge. ● End mill style.	Ø1.500" | Ø3.000"	P M K N S H	K048
ASX445 45° KAPR	6 mm	● Precision molded 20° positive insert. ● A wide range of chip breakers. ● Screw-on type. ● High rigidity due to employment of a carbide shim.	Ø50 mm Ø63 mm Ø80 mm	P M K N S H	K057
AOX445 45° KAPR	8 mm	● Octagonal double-sided solid CBN insert. ● Economical 16 corner use. (when depth of cut is 3mm or less) ● High efficiency machining from roughing to finishing. ● Easy operation and cleaning.	Ø50 mm Ø63 mm	K	K095
AJX	.079"	● 13°, 15° positive insert. ● Air / coolant through. ● High rigidity due to double clamp structure. ● Suitable for high feed cutting. ● Special designed insert with the use of 3 cutting edges.	Ø.625" | Ø2.000"	P M K S H	K286
WWX200 NEW 90° KAPR	.197"	● High-stability clamping and high-quality machining. ● The optimized “X-type” insert meets the demand for greater strength. ● Economical double-sided 6 corners.	Ø1.000" | Ø1.500"	P M K S H	K114
WWX400 NEW 90° KAPR	.323"	● High-stability clamping and high-quality machining. ● The optimized “X-type” insert meets the demand for greater strength. ● Economical double-sided 6 corners.	Ø2.000" | Ø3.000"	P M K N S H	K123
ASX400 90° KAPR	.394"	● Economical due to the use of 4 cutting edges. ● Low resistance due to the 3D design of the curved cutting edge. ● Curved cutting edge and high rigidity holder. ● Max. depth of cut .394".	Ø1.250" | Ø2.000"	P M K N S H	K140
VPX200 90° KAPR	.315"	● Special designed insert with 4 cutting edges. ● High precision, high quality insert cutting edge with finishing blade. ● Through coolant holes.	Ø.625" | Ø1.500"	P M K N S H	K182
VPX200 Long Cutting Edge NEW 90° KAPR	1.654"	● Special designed insert with 4 cutting edges. ● High precision, high quality insert cutting edge with finishing blade. ● Through coolant holes.	Ø.875" | Ø1.500"	P M K N S	K188

CLASSIFICATION (SHANK TYPE)

Product Name · Shape	APMX	Features	Cutter Dia.	Workpiece Material	Page
VPX200 Shell Type NEW 90° KAPR	1.654"	●Special designed insert with 4 cutting edges. ●High precision, high quality insert cutting edge with finishing blade. ●Through coolant holes.	Ø1.250" | Ø2.000"	P M K N S	K189
VPX300 90° KAPR	.433"	●Special designed insert with 4 cutting edges. ●High precision, high quality insert cutting edge with finishing blade. ●Through coolant holes.	Ø1.000" | Ø1.500"	P M K N S H	K193
VPX300 Long Cutting Edge NEW 90° KAPR	1.654"	●Special designed insert with 4 cutting edges. ●High precision, high quality insert cutting edge with finishing blade. ●Through coolant holes.	Ø1.500"	P M K N S	K199
VPX300 Shell Type NEW 90° KAPR	2.874"	●Special designed insert with 4 cutting edges. ●High precision, high quality insert cutting edge with finishing blade. ●Through coolant holes.	Ø1.500" | Ø3.000"	P M K N S	K200
APX3000 90° KAPR	.394"	● Air / coolant through. ● Low resistance insert and high rigidity body. ● Ideal chip control. ● High wall accuracy can be produced by using this cutter and unique insert geometry.	Ø.500" | Ø1.500"	P M K N S H	K154
APX3000 Long Cutting Edge 90° KAPR	2.165"	●High accuracy, high quality vertical wall. ●Low cutting force insert.	Ø.750" | Ø1.500"	P M K N S	K164
APX3000 Shell Type 90° KAPR	1.811"	●High accuracy, high quality vertical wall. ●Low cutting force insert. ●Through coolant holes.	Ø2.000"	P M K N S	K164
APX4000 90° KAPR	.591"	● Air / coolant through. ● Low resistance insert and high rigidity body. ● Ideal chip control. ● High wall accuracy can be produced by using this cutter and unique insert geometry.	Ø.750" | Ø1.500"	P M K S H	K168
APX4000 Long Cutting Edge 90° KAPR	3.300"	●High accuracy, high quality vertical wall. ●Low cutting force insert. ●Through air & coolant holes.	Ø1.500" | Ø2.000"	P M K S	K178

Product Name · Shape	APMX	Features	Cutter Dia.	Workpiece Material	Page
APX4000 **Shell Type** 90° KAPR	2.200"	●High accuracy, high quality vertical wall. ●Low cutting force insert. ●Through coolant holes.	Ø2.000" Ø2.500"	P M K S	K178
AXD4000 90° KAPR	.610"	● Air / coolant through. ● Low resistance insert. ● High balance quality. ● Excellent wall accuracy. ● Multi functional milling.	Ø1.000" | Ø1.500"	P N S	K226
AXD7000 90° KAPR	.827"	● Air / coolant through. ● Low resistance insert. ● High balance quality. ● Excellent wall accuracy. ● Multi functional milling.	Ø1.250" Ø1.500"	P N S	K246
BXD4000 90° KAPR	.591"	● Air / coolant through. ● Low resistance insert & high rigidity body. ● The Anti Fly Insert mechanism guarantees secure high-revolution milling.	Ø1.000" | Ø1.500"	P M N S H	K258
AQX 90° KAPR	1.500"	● Air / coolant through. ● The center bottom cutting edge enables drilling and end milling without prepared hole.	Ø.625" | Ø1.500"	P M K N S H	K276
ARP R KAPR	.236"	● Air / coolant through. ● Round Insert Cutter for Difficult-to-cut Material. ● High run-out accuracy when indexing inserts. ● Solid clamping system.	Ø1.000" | Ø2.000"	M S	K329
ARX R KAPR	.138"	● Precision M-class 15°positive insert. ● Effective for various machining applications. ● Air / coolant through.	Ø10 mm | Ø25 mm	P M K H	K340
WJX09 NEW 	.047"	●Multi functional milling. ●Negative inserts. ●Stable clamp with dovetail structure. ●Suitable for high feed machining. ●Special designed insert with 6 cutting edges. ●Through coolant holes.	1.000" | 1.500"	P M K S H	K309
WJX14 	.079"	●Multi functional milling. ●Negative inserts. ●Stable clamp with dovetail structure. ●Suitable for high feed machining. ●Special designed insert with 6 cutting edges. ●Through coolant holes.	Ø50 mm	P M K S H	K322

CLASSIFICATION (SHANK TYPE)

Product Name · Shape	APMX	Features	Cutter Dia.	Workpiece Material	Page
BRP R KAPR	.302"	● 11° positive insert. ● Round shape insert gives strong cutting edge. ● A wide variety of lengths available. ● Suitable for machining of die and mold. ● Max.depth of cut .146"–.302".	Ø.500" | Ø2.500"	P M K S H	K344
LER 90° KAPR	2.500"	● Different helical flute angles prevents chattering. ● Suitable for heavy cutting due to holder rigidity.	Ø1.000" | Ø2.000"	P M K	K274
SPX 90° KAPR	6.200"	● The wavy cutting edge helps to reduce cutting resistance. ● Suitable for heavy machining due to holder rigidity.	Ø1.969" Ø2.000"	P M K S	K268
SPX Shell Type 90° KAPR	2.280"	● The wavy cutting edge helps to reduce cutting resistance. ● Suitable for heavy machining due to holder rigidity.	Ø2.500" Ø3.000"	P M K S	K269
ASPX Shell Type NEW 90° KAPR	2.953"	● Highly reliable clamping mechanism. ● Low cutting resistance due to the use of wavy inserts. ● Suitable for heavy cutting due to holder rigidity.	Ø2.000" | Ø3.000"	S	K262
ASPX NEW 90° KAPR	5.000"	● Highly reliable clamping mechanism. ● Low cutting resistance due to the use of wavy inserts. ● Suitable for heavy cutting due to holder rigidity.	Ø3.000"	S	K263
SRF R KAPR	.669"	●S-shaped cutting edge provides sharpness similar to that of solid ball nose end mills. ●Highly accurate corner radius tolerance allows for high precision finishing. ●Carbide shank type available.	Ø.375" | Ø1.260"	P K N H	K350
SUF R KAPR	.205"	●Highly accurate corner radius tolerance allows for high precision finishing. ●Seamless gash.	Ø.394" | Ø1.250"	P M K H	K350
SRM2 R KAPR	1.732"	● Air / coolant through. ● Suitable for roughing to semi-finishing of small and medium molds. ● High rigidity body design. ● Low resistance chip breaker. ● Key type clamp. ● Shrink fit ready.	Ø.625" | Ø1.250"	P M K S H	K362

Product Name · Shape	APMX	Features	Cutter Dia.	Workpiece Material	Page
SRM2 ϕ40/ϕ50 (ϕ1.575"/ϕ1.969") R KAPR	2.480"	● Best for roughing of molds. ● Low resistance chip breaker. ● Highly rigid body.	Ø40 mm (Ø1.575") Ø50 mm (Ø1.969")	P K	K374
CFSP 45° KAPR	.327"	● Excellent sharpness with 11°positive inserts. ● 45°chamfer series.	Ø.313" | Ø1.250"	P K	K348
PMF	—	● 2 directional cutting with large overhang. ● No burring so no need for hand finishing. ● High precision multi directional insert ensures highly accurate surfaces.	Ø50 mm | Ø80 mm	P K	K378
PMR	.433"	● 1 directional cutting with large overhang. ● Unique shape of curved edge gives high rigidity and low resistance.	Ø50 mm | Ø80 mm	P K	K379

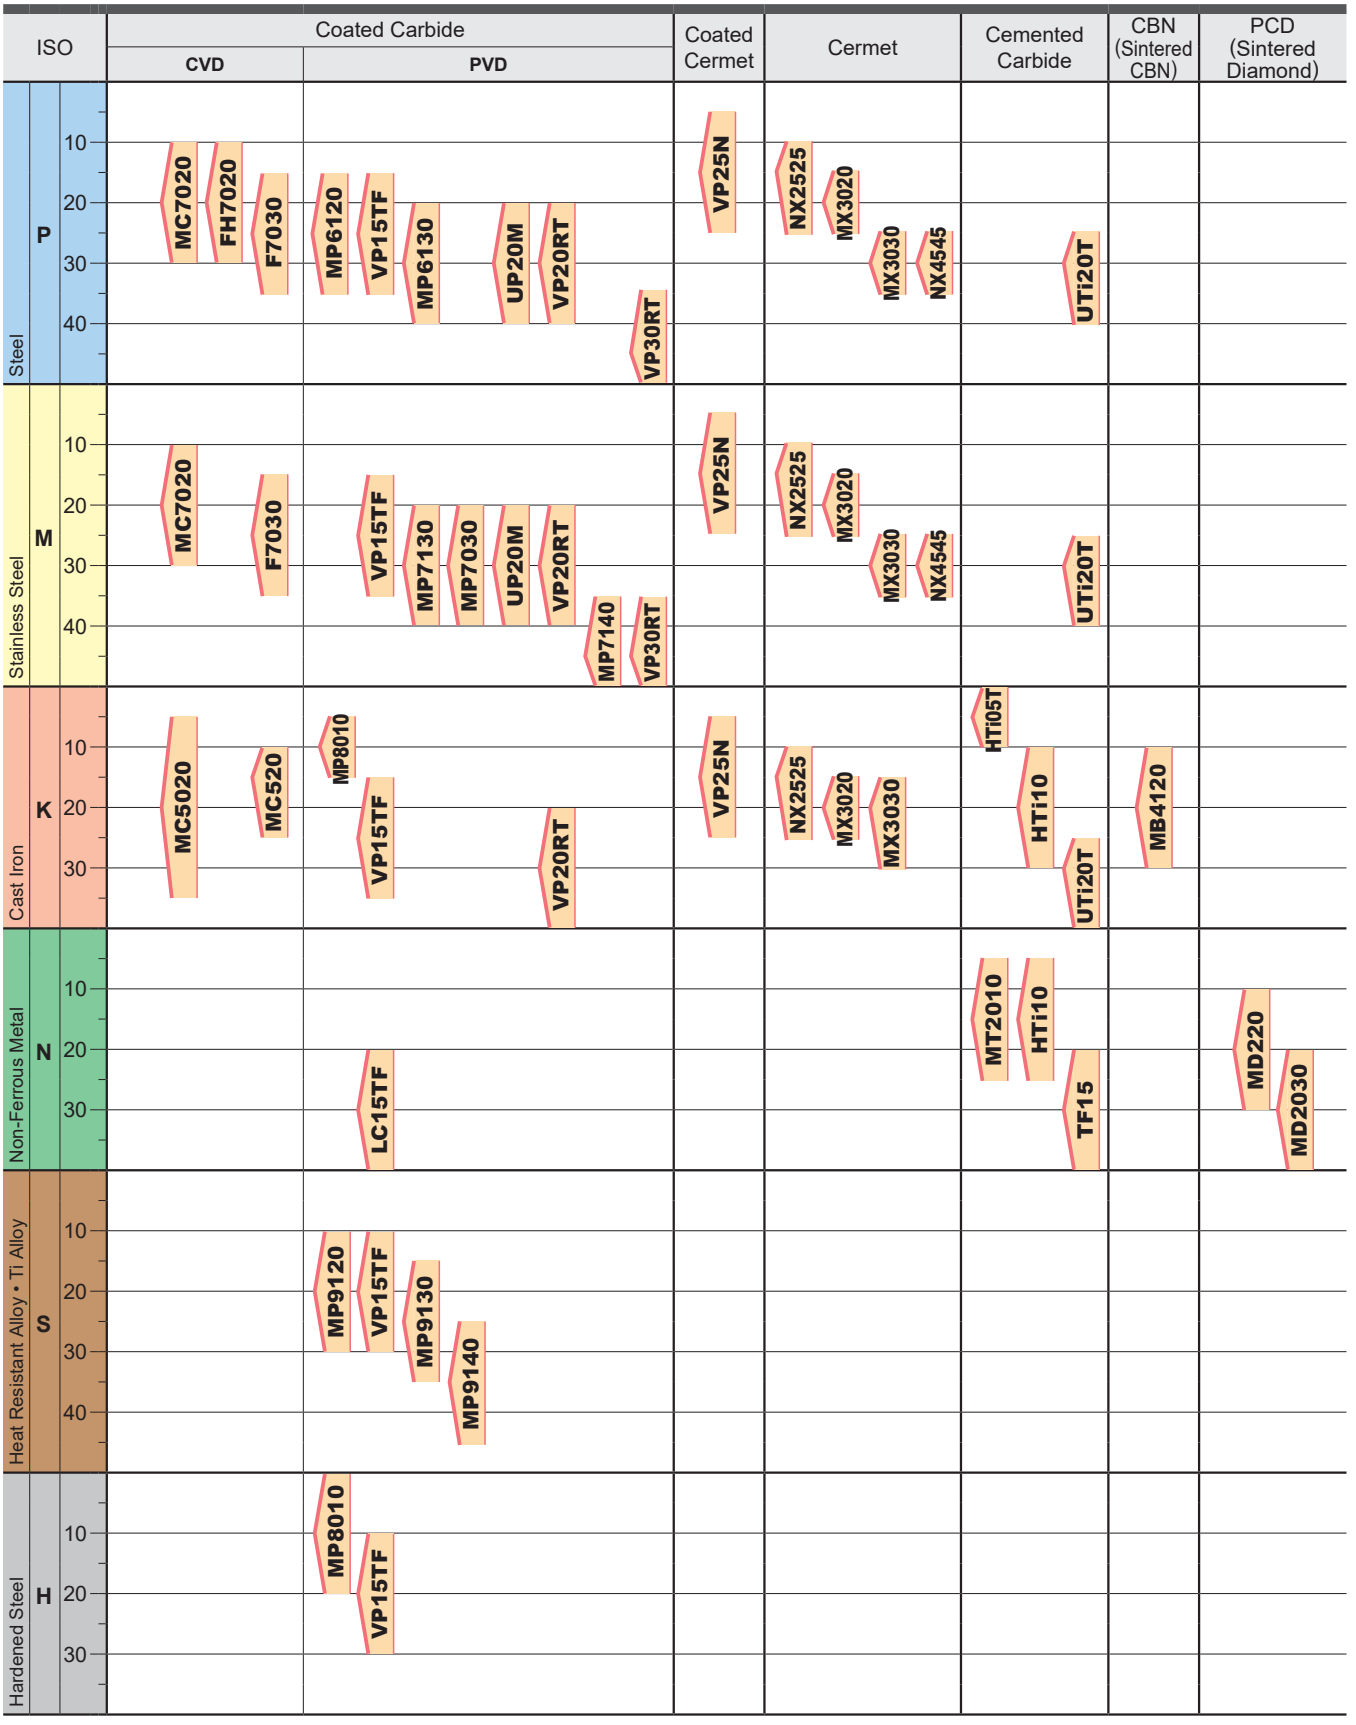
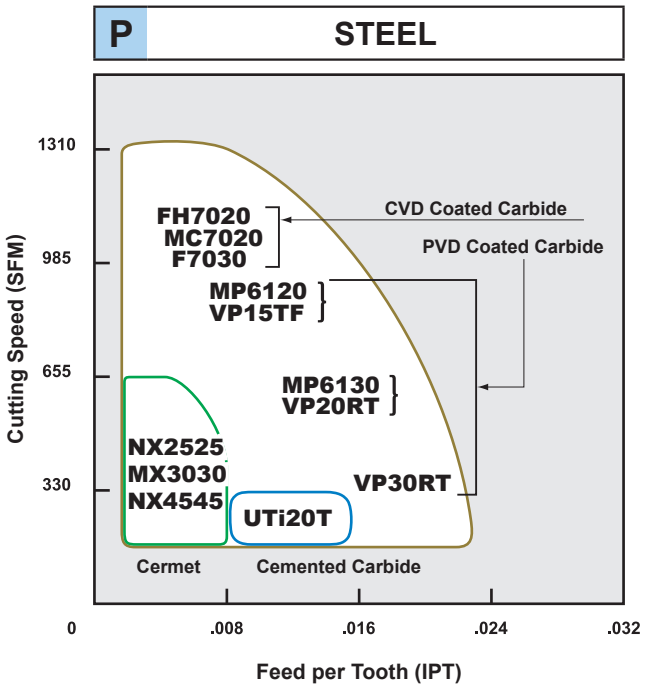
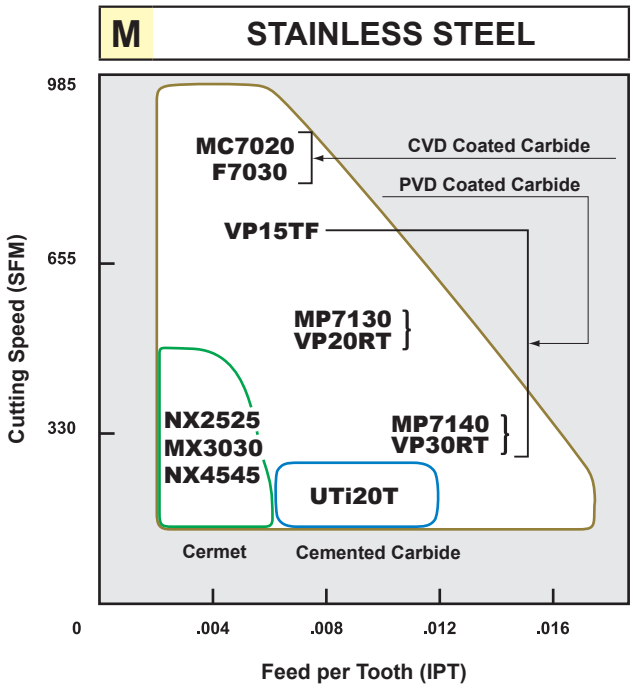
GRADES FOR MILLING

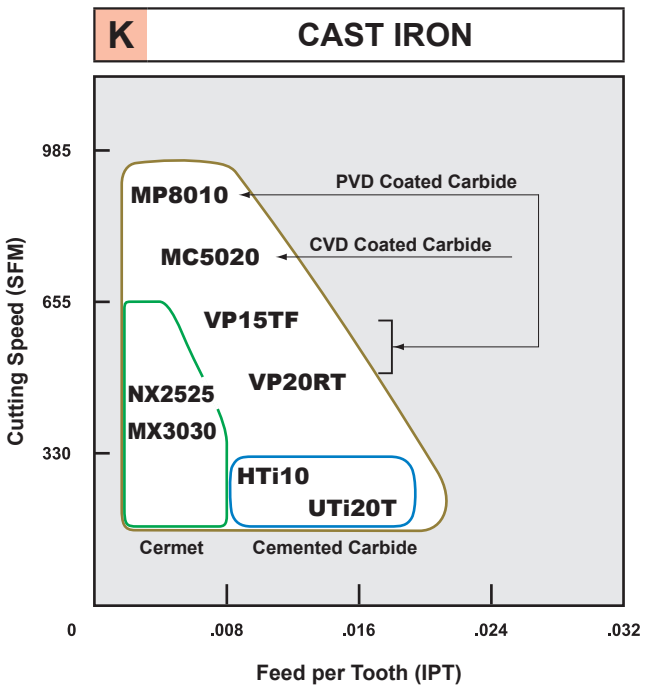
●INDEXABLE INSERT GRADES FOR MILLING

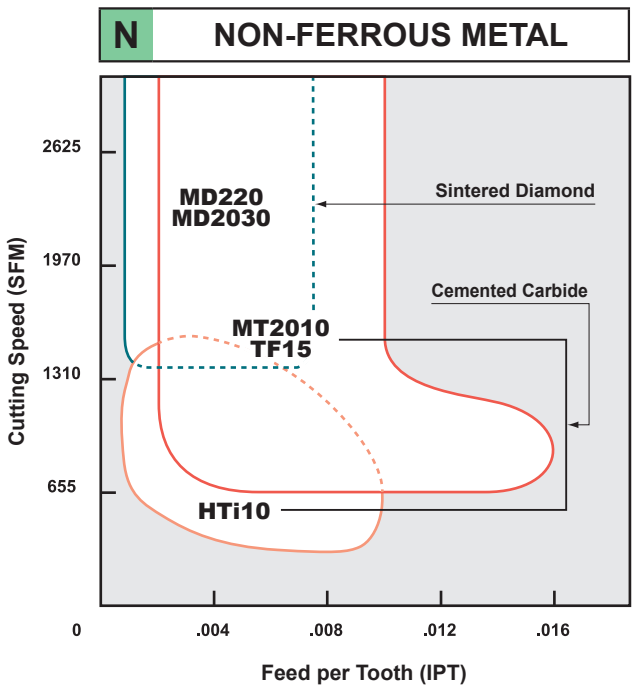


MILLING APPLICATION RANGE





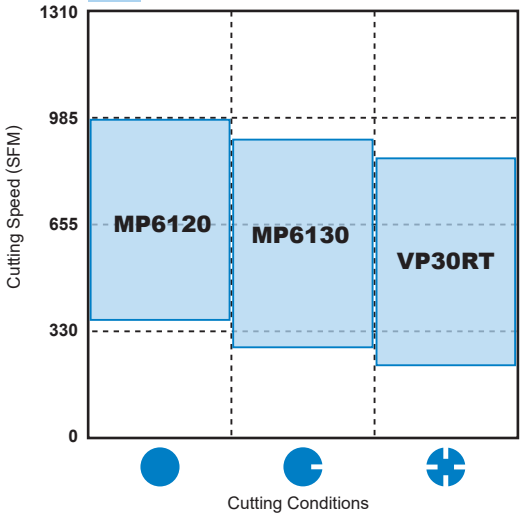




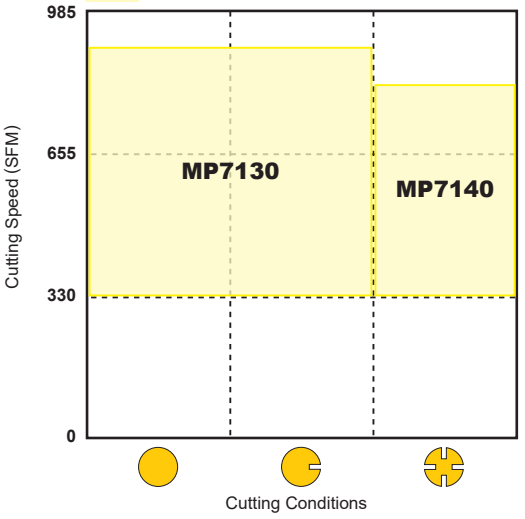
MILLING APPLICATION RANGE

●Recommendation of the main insert grade based on cutting speed and conditions for each workpiece.

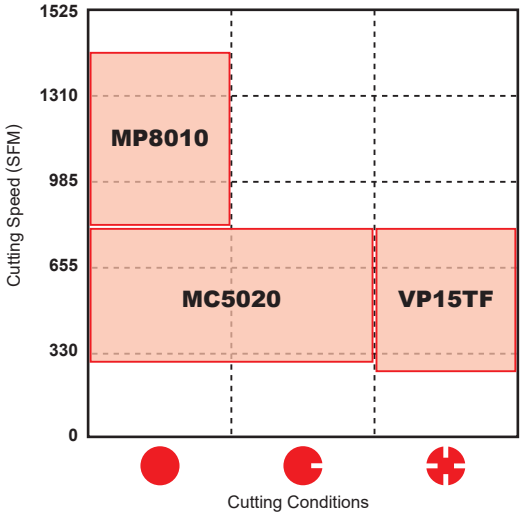
P STEEL (Medium-Rough Cutting)



M STAINLESS STEEL



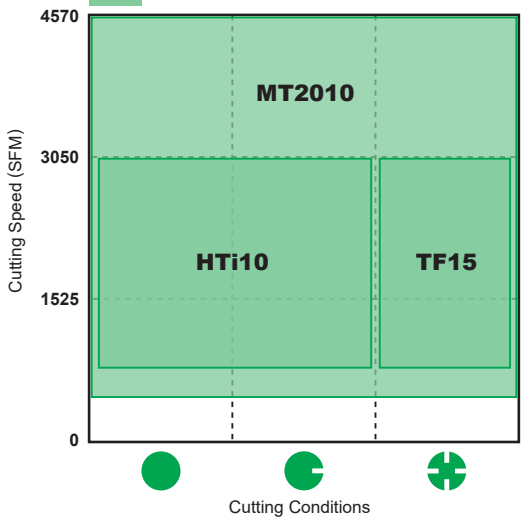
K CAST IRON



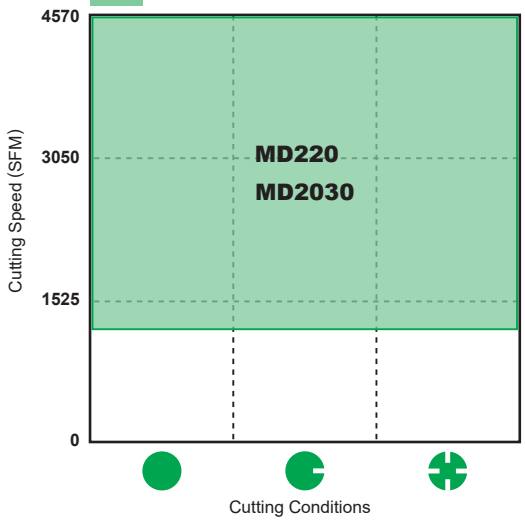
■CUTTING CONDITIONS

●	Stable Cutting	Continuous Cutting Constant Depth of Cut Pre-Machined Securely Clamped Component
◕	General Cutting	
✚	Unstable Cutting	Heavy Interrupted Cutting Irregular Depth of Cut Low Clamping Rigidity

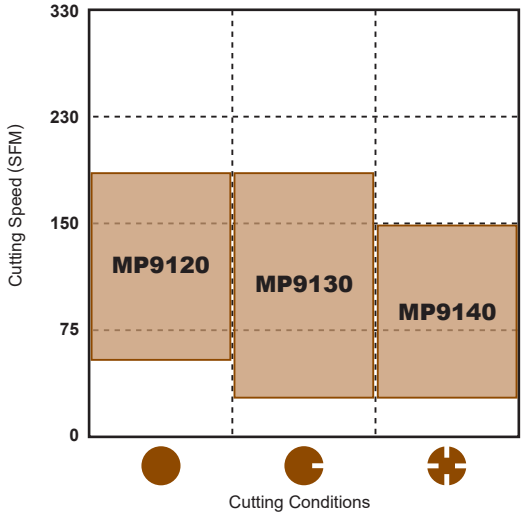
N NON-FERROUS METAL



N NON-FERROUS METAL (PCD)



S HEAT RESISTANT ALLOYS, TITANIUM ALLOYS



COATED CARBIDE (CVD&PVD)

<CVD>
- Special tough fibrous structure improves wear and fracture resistance.
- It covers a wide application range and reduces the number of tools required.

<PVD>
- PVD coating prolongs tool life when compared to cemented carbide under the same cutting conditions.
- Coating of tools with sharp edges is possible without softening or changing the quality of the substrate.

■SELECTION STANDARD

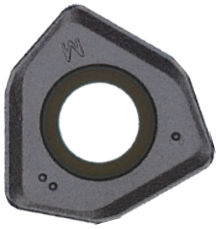
MP7140	88.8	(Al,Ti)N-Ti Compound	Thin

Grade	Substrate	Coating Layer	
	Hardness (HRA)	Composition	Thickness
MP8010	93.5	(Al,Ti,Si)N	Thin
MP9120	91.5	(Al,Ti,Cr)N	Thin
MP9130	90.5	(Al,Ti,Cr)N	Thin
MP9140	89.0	(Al,Ti)N	Thin
VP15TF	91.5	(Al,Ti)N	Thin
VP20RT	90.5	(Al,Ti)N	Thin
VP30RT	88.8	(Al,Ti)N	Thin
UP20M	90.5	TiN-TiCN-TiN	Thin

Note 1) The hardness values shown represent the typical values of the internal hardness.

For machining of steel and stainless steel

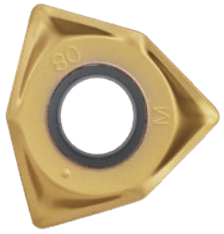
MC7020



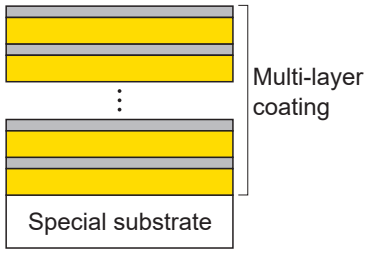
The micro-grain wear resistant Al_2O_3 and fibrous TiCN layers deliver excellent wear resistance in high-speed cutting. Use of a specially developed cemented carbide that provides superior resistance to fracture and thermal cracking prevents the cutting edge from sudden fracturing.

For machining of stainless steel

MP7130



MP7130 has a multi-layer coating based on a newly developed Ti-compound. It provides superior wear and fracture resistance in stainless steel machining. A special tough cemented carbide substrate gives excellent performance in machining of difficult-to-cut materials such as stainless steel.



Heat resistant Alloys, Cutting For Titanium Alloys

MP9130

An enhanced super fine cemented carbide substrate has increased toughness while maintaining hardness. The Al-Ti-Cr-N accumulative coating ensures optimum heat and wear resistance. The combination of these properties gives excellent fracture resistance and welding resistance because of low coefficient of friction when machining titanium alloys.

MP9140

The new technology Al-(Al, Ti)N coating provides stabilization of the high hardness phase and succeeds in dramatically improving wear, crater and welding resistance.

CERMET

- NX2525 for high-speed milling.
- NX4545, MX3030 for general milling.

■SELECTION STANDARD

MILLING

Workpiece Material	Recommended Grade	ISO	Application Range
P Steel Stainless Steel M	NX2525 MX3030 NX4545	P 10 20 30 M	NX2525 MX3020 MX3030 NX4545
K Cast Iron	NX2525 MX3030	K 10 20	NX2525 MX3020 MX3030

Note 1) In case of wet cutting, please use coated carbide VP15TF for steel cutting and coated carbide MC5020 for cast iron cutting.

■GRADE CHARACTERISTICS

Grade	Hardness (HRA)
NX2525	92.2
MX3030	91.0
NX4545	90.0

Note 1) The hardness values shown represent the typical values of the internal hardness.

CEMENTED CARBIDE

● **Available grade series are UTi20T for steel and cast iron, and HTi10 for cast iron, non-ferrous metal and non-metal.**

■SELECTION STANDARD

MILLING

P M	WC-TiC-TaC-Co	Heat / Deformation resistance.	Carbon steel, Alloy steel, Stainless steel and Cast iron
K N	WC-Co	High rigidity and wear resistance.	Cast iron, Non-Ferrous metals and Non-metal

■GRADE CHARACTERISTICS

ISO	Grade	Hardness (HRA)
P M	**UTi20T**	90.5
K N	**HTi05T**	92.5
	HTi10	92.0
N	**MT2010**	91.8
	TF15	91.5

Note 1) The hardness values shown represent the typical values of the internal hardness.

CBN (SINTERED CBN)

- MB4120 high efficiency machining of cast iron.
- BC5030 high-speed machining of cast irons available.
- The combination of the BC5030 insert geometry and the AOX allows the use of up to 16 corners per insert, enabling cost effective, high efficiency machining.

■SELECTION STANDARD / RECOMMENDED CUTTING CONDITIONS

Recommended Cutter : FMAX

Workpiece Material		Structure	Cutting Speed (SFM) 820 1640 2460 3280 4100	Feed per Tooth (IPT)	Depth of Cut (inch)	Coolant
Grey Cast Iron	AISI No45B	Pearilitic	MB4120	—.006	—.020	Dry

Recommended Cutter : AOX445

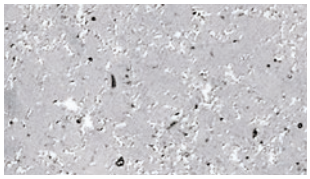
Workpiece Material		Structure	Cutting Speed (SFM) 820 1640 3280 4920 6560	Feed per Tooth (IPT)	Depth of Cut (inch)	Coolant
Grey Cast Iron	AISI No35B	Pearilitic	BC5030	—.006	—.118	Dry

■FEATURES AND BASE

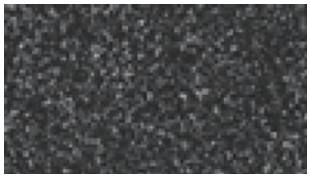
Grade	Application	Features	Main Component	Coating Layer
NEW MB4120	High Efficiency Machining High-Speed Cutting Interrupted Cutting	Fine CBN particles increase cutting edge toughness. The high fracture resistance allows stable performance even during interrupted machining. Optimized grade prevents fracture, edge chipping and thermal cracks under both dry cutting conditions and when cutting workpieces following the wet cutting process.	CBN Co Base Alloy	—
BC5030	High-speed machining at large depths of cut High-speed interrupted machining at large depths of cut	High CBN content and high thermal conductivity. The whole insert is composed of sintered CBN. This enables high-speed, high efficiency machining at larger depths of cut. The coated grade for easy recognition of used corners.	CBN AlN	TiN

PCD (SINTERED DIAMOND)

- **Suitable for cutting of non-ferrous metals such as aluminum alloys.**
- **Suitable for extremely high-speed finishing.**



Micro-Structure of **MD220**



Micro-Structure of **MD2030**

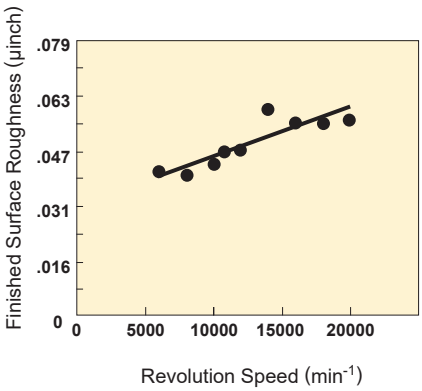
■GRADE FEATURES

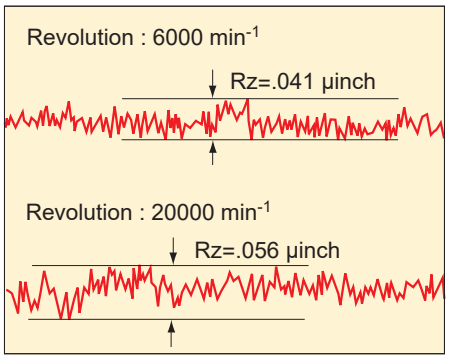
Grade	Features
MD220	Excellent in the balance between wear resistance and fracture resistance. For a wide range of tooling applications.
MD2030	Improved fracture resistance when used in unstable applications. The stability of the cutting edge can meet a wide variety of workpiece material and cutting conditions.

■RECOMMENDED CUTTING CONDITIONS

Workpiece Material	Cutting Speed (SFM)	Grade	Feed per Tooth (IPT)	Depth of Cut (inch)
Aluminum Alloy (Si ≤12%)	3280—19685	**MD220** **MD2030**	—.012	—.020
Aluminum Alloy (Si ≥13%)	655—2625			

■CUTTING PERFORMANCE





<Cutting Conditions>
Workpiece Material : Aluminum Alloy
Insert : NP-GDCW1240PDFR2
Grade : MD220
Tool : V10000R0406D
Feed per Tooth : .008 IPT
Depth of Cut : .020 inch
Width of Cut : 3.150 inch
Dry Cutting

Note 1) Cutting edge diameter tolerance when the gauge insert is set.
Note 2) When setting the insert available, the insert tolerance is added to the above tolerance.
(Tolerance when setting the insert for SRF.)

■ Instructions for Use of Wiper Inserts

Fig.1

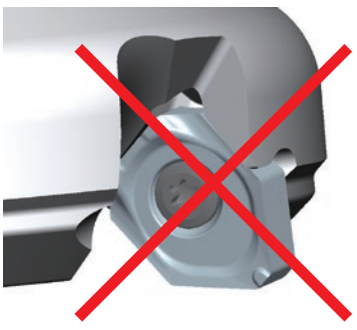

Fig.2

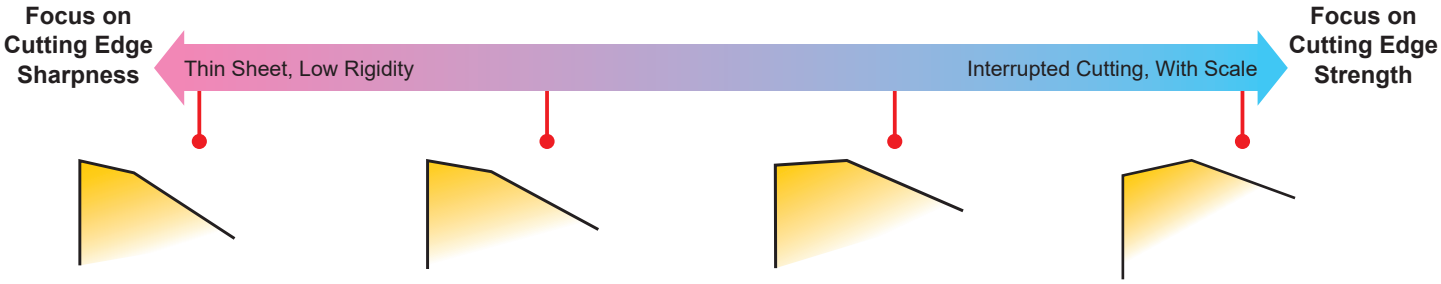
Wiper inserts for WSX445 are two-cornered. Please set as shown in Fig.1.
Excellent surface finish can be achieved with one wiper.
Set more than 2 wiper inserts, equally spaced, when the feed per revolution is larger than .315 IPR.

● : **USA Stock**
<10 inserts in one case>

Breaker System

Breaker Series for Varied Cutting Conditions



L Breaker

Focus on cutting edge sharpness
Low resistance type

- For machining difficult-to-cut materials
- For when the machine or the workpiece rigidity is low

M Breaker

1st Recommendation
All-around

- For general cutting

R Breaker

For unstable applications
Reinforced edge type

- For interrupted cutting

H Breaker

For demanding applications
Reinforced edge type

- For heavy interrupted cutting

Workpiece Material	Cutting Conditions		
	Light Cutting	General Cutting	Heavy Cutting

Note 1) Refer to the table above and set the cutting conditions to match the application.
Note 2) Wet cutting is recommended, when focusing on the surface finish. (Life is lower than dry cutting.)

■ Instructions for using JP breaker handling

Note 1) The JP breaker has sharp cutting edge. Please wear gloves when installing to prevent.
Note 2) During machining of aluminum alloy, chip welding can occur that can cause fracturing of the insert.
Note 3) Wet cutting is recommended.

*Wiper inserts are single-cornered.
*PCD grade MD220 is for aluminum alloy.

■Instructions for use of wiper inserts

Fig.1

Fig.2

Note 1) These wiper inserts are single-cornered.
Note 2) Install the insert so that the cutting edge is located as shown in Fig. 1.
Do not install the wiper insert as shown in Fig. 2. (The insert may be damaged by a too heavy cutting load.)
Note 3) Recommended depth of cutting is ap=.008"-.020". (Be aware of the cutting load if the depth of cut is over the recommendation.)
Note 4) The major cutting edge of a wiper insert is set more inside than a general tooth.
This is to prevent heavy loads on the wiper insert. (To prevent fracture set the feed under .008 inch/t.)
Note 5) Excellent finished surface can be obtained with one wiper insert.
Note 6) When the feed per revolution is larger than the width of the wiper edge, install 2 or more wiper inserts equally inside the cutting body.

RECOMMENDED CUTTING CONDITIONS WHEN USING A WIPER INSERT

Workpiece Material	Grade	Recommended Cutting Speed (SFM)
P	VP25N	655 (260–820)
	VP15TF	590 (260–820)
M	VP15TF	390–885
K	MC5020	425–820
	VP15TF	
S	VP15TF	65–165
H	VP15TF	130–260
N	MD220	2130 (985–3280)

●Recommended depth of cut (ap) is .008"-.020" and feed per tooth (fz) is up to .008 inch/t.

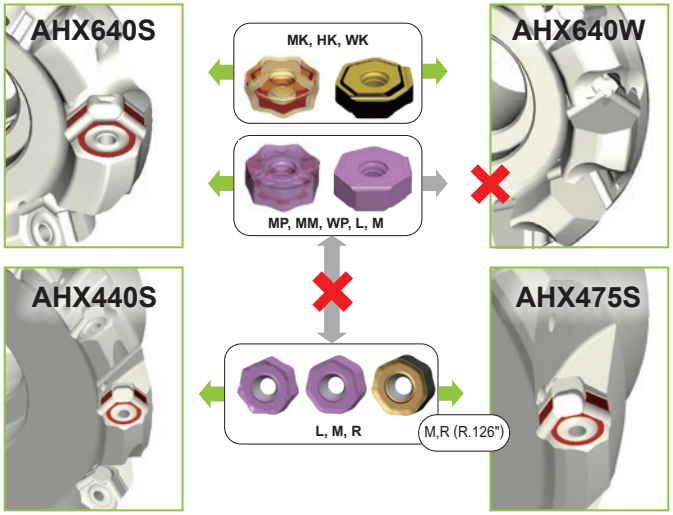
	Super Extra Fine Pitch	16	●	.126 — .252	.118						
8.000" 200 mm	Coarse Pitch	8							●	.063 — .126	.236
	Fine Pitch	12							●	.094 — .189	.236

Note 1) fr: Feed rate per revolution (AHX475S: the feed rate per cutter (fz) will be limited by the cutting width ae. Please refer to page K073 for details.)
Note 2) APMX: Maximum depths of cut (AHX440S: the maximum depths of cut will vary depending on the breaker)
Note 3) The depths of cut and feed rate are identical to the recommended conditions for carbon steel and alloy steel.

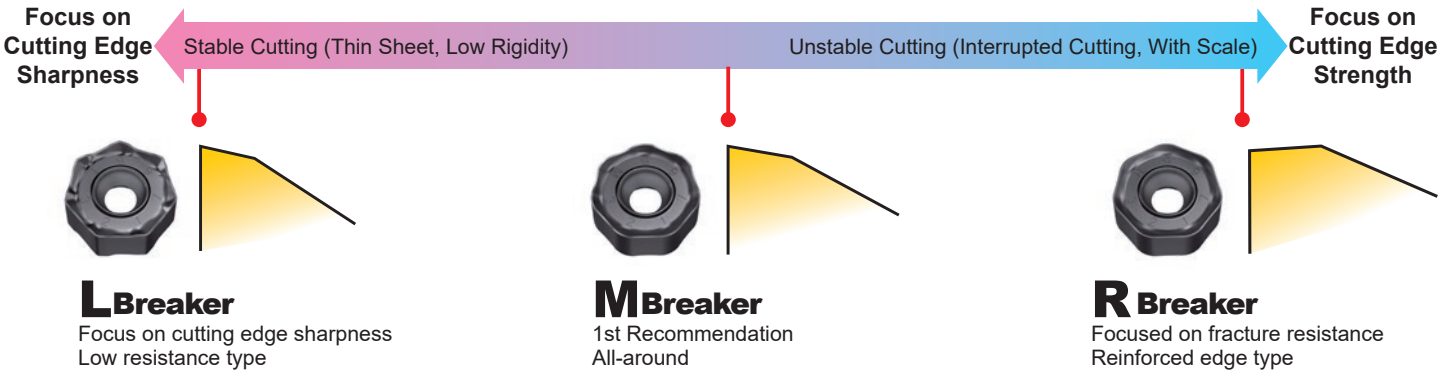
Compatibility with Inserts for AHX Series

The RE = .126 inch insert for use with AHX440S can be mounted on AHX475S.
All inserts for use with AHX640 can be mounted on AHX640S (note, however, that the set height will differ).
The inserts for mounting on AHX640W are the MK, HK, and WK breakers for casting.



Breaker System

Breaker Series for Varied Cutting Conditions



L Breaker
Focus on cutting edge sharpness
Low resistance type

M Breaker
1st Recommendation
All-around

R Breaker
Focused on fracture resistance
Reinforced edge type

Workpiece Material	Cutting Conditions		
	Stable Cutting	General Cutting	Unstable Cutting
P	AHX440S: L (With Wiper); M (R.031") (With Wiper); M (R.126") (Not with Wiper, Shared with AHX475); R (Not with Wiper, Shared with AHX475)		
	AHX640S: M; MP		
M	AHX440S: L (With Wiper); M (R.031") (With Wiper); M (R.126") (Not with Wiper); R (Not with Wiper)		
	AHX640S: MM		
K	AHX440S: L (With Wiper); M (R.031") (With Wiper); M (R.126") (Not with Wiper, Shared with AHX475); R (Not with Wiper, Shared with AHX475)		
	AHX640S: MK; HK		

Wiper Insert of AHX640S

Based on the number of inserts and the cutting conditions, use of wiper inserts can improve overall surface finishes.

P

WP + combination with **MP**
Right-hand 2 corners, left-hand 2 corners.

K

WK + combination with **MK**
Right-hand 2 corners, left-hand 2 corners.

■Instructions for Use of Wiper Inserts

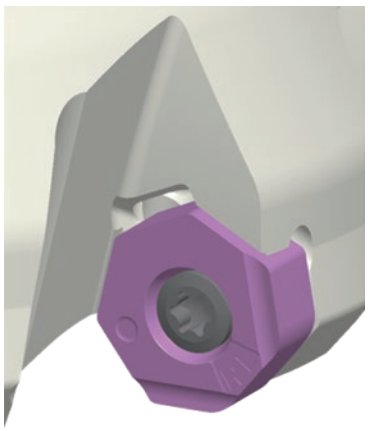

Fig.1

Fig.2

Note 1) The specifications for these wipers are right hand body 2 corners and left hand body 2 corners. Refer to Figure 1.
Note 2) Satisfactory finish surface can be achieved with one wiper insert.
However, if the feed rate per revolution will be equal to or greater than the width of the wiper edge, it is recommended to install the second and further wiper inserts spaced evenly within the cutting body.

			MP7140	165 (100—230)	.004 (.002—.006)	≤.118

Note 1) Refer to the above table and set up cutting conditions according to cutting applications.
Note 2) When placing emphasis on surface finish quality, wet cutting is recommended. (tool life is lowered as compared to dry cutting)
Note 3) The recommended depth of cut differs according to insert geometry.
Note 4) When clamp rigidity is low and tool overhang is long, we recommended to reduce the cutting speed and the feed rate by 30%.
Note 5) Recommended wet cutting for good surface finishing of stainless steel. (Tool life is short compared to wet cutting.)

			VP15TF	560 (490—655)	.008 (.004—.012)	≤.020
H	Hardened Steel	40—55HRC	**VP15TF**	260 (195—330)	.006 (.004—.008)	≤.020

Note 1) Refer to the above table and set up cutting conditions according to cutting applications.
Note 2) When placing emphasis on surface finish quality, wet cutting is recommended. (tool life is lowered as compared to dry cutting)
Note 3) The recommended depth of cut differs according to insert geometry.
Note 4) When clamp rigidity is low and tool overhang is long, we recommended to reduce the cutting speed and the feed rate by 30%.
Note 5) Recommended wet cutting for good surface finishing of stainless steel. (Tool life is short compared to wet cutting.)

■ Instructions for use of wiper inserts

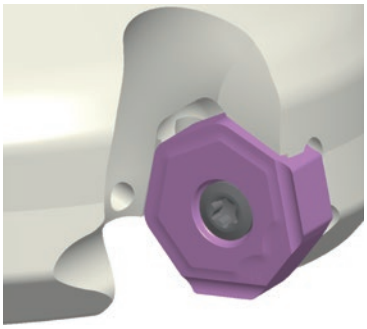

Fig.1

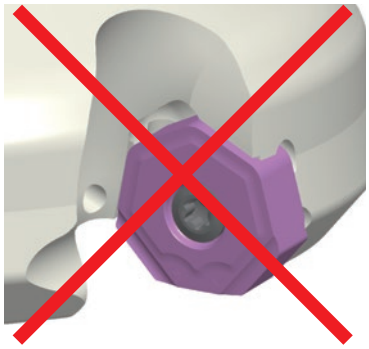

Fig.2

Note 1) The specifications for these wipers are right hand body 2 corners and left hand body 2 corners. Refer to Figure 1.
Note 2) A satisfactory finish surface can be achieved with one wiper insert.
However, if the feed rate per revolution will be equal to or greater than the width of the wiper edge, it is recommended to install the second and further wiper inserts spaced evenly within the cutting body.

Note1) Recommended wet cutting for good surface finishing of stainless steel. (Tool life is short compared to wet cutting.)
Note2) We recommend wet cutting with internal coolant for titanium alloy and heat resistant alloy,
Note3) When clamp rigidity is low and tool overhang is long, we recommended to reduce the cutting speed and the feed rate by 30%.

RECOMMENDED CUTTING CONDITIONS

■ Dry·Wet Cutting

(inch)

Workpiece Material		Tensile Strength	Grade	vc (SFM)	fz (IPT)
K	Gray Cast Iron	≤350MPa	MC5020	720 (490—985)	.012 (.008—.016)
			VP15TF VP20RT	590 (425—755)	.012 (.008—.016)
	Ductile Cast Iron	≤450MPa	MC5020	655 (490—820)	.008 (.004—.012)
			VP15TF VP20RT	560 (395—720)	.008 (.004—.012)
		≤800MPa	MC5020	560 (490—655)	.008 (.004—.012)
			VP15TF VP20RT	460 (330—590)	.008 (.004—.012)

■ Finishing (Use of Wiper Inserts)

(inch)

Workpiece Material		Grade	ap	vc (SFM)	fz (IPT)
K	Gray Cast Iron	MC5020	<.0197	1050 (820—1310)	.008 (.004—.012)
			.0197—.118	855 (655—1150)	
	Ductile Cast Iron		<.0197	855 (655—1150)	
			.0197—.118	720 (655—820)	

*In the case of IPR > .236 IPR, it is possible to use 2 or 3 wiper inserts for finish machining.

Note 1) With reference to the above examples, adjust the cutting conditions according to the use environment.
Note 2) Tool life when wet cutting is short compared to dry cutting.

For Aluminum Alloys : Sharp Edge
For Gray Cast Iron : Chamfered and Rounded (0.13mmx15°+R0.01)

Note 1) If general purpose inserts (RE = .016", .031"), burr prevention inserts and long edge inserts are used together, they will not be able to sufficiently display their full performance. Inserts of the same shape should be used according to the application.
Note 2) The cutting diameter will change depending on the shape.
Be particularly careful when cutting near vertical walls, since there is a possibility of interference with the holder.
Note 3) The long edge inserts corresponds to the gate remainder and can not be used for constant depth cutting.

How to Use Wiper Insert for Best Results

- The WSF406W can obtain a good surface finish when using a standard insert due to the adjustable run-out system, but by using a wiper insert an excellent surface finish can be achieved without having to set a high accuracy face run-out. When a wiper insert is mounted, aim to set the standard insert run-out accuracy to within .0016 inch.
- Just one wiper insert is enough to achieve excellent finished surfaces.
  However, if the feed per revolution is greater than .197 IPR, attach two or more wiper inserts so that they are evenly spaced in the cutter body and set the run-out accuracy between multiple wiper inserts to within .0001 inch before use.

Note 1) DC is cutter diameter.

Note 2) When using wiper insert, please reduce the feed per tooth to half the normal rate.

■ Usable cutting edge width of wiper inserts

The width of the wiper insert itself is .217 inch, however the actual functioning cutting edge width after installation to the body is .177 inch, as shown in the diagram.

With one wiper insert, it is possible to machine up to fr=.157 inch feed per revolution. When exceeding fr=.157 inch, use two or more wiper inserts. Note that there is a possibility to exceed fr=.157 inch when using a holder with more than 24 inserts.

* Y=Yes, N=No

Note1) A set bolt to the arbor is not supplied with the body. Please refer to page K126, when ordering.

Note2) Please use a set bolt of the FMC type on the cutter body from 63 to 100 in diameter(DC).

Note3) Please use a set bolt of the FMA type on the cutter body from 125 to 250 in diameter(DC).

■ Instructions for Use of Wiper Inserts

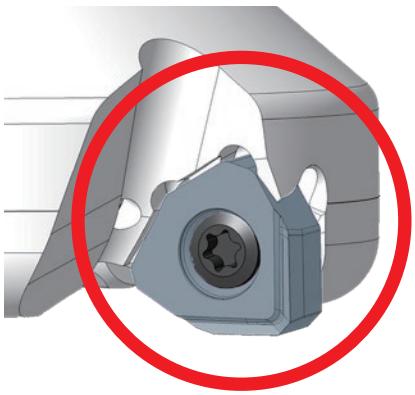

Fig.1

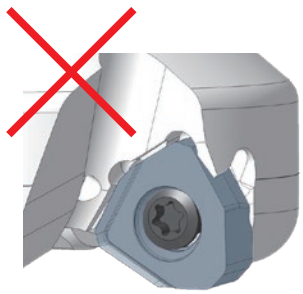

Fig.2

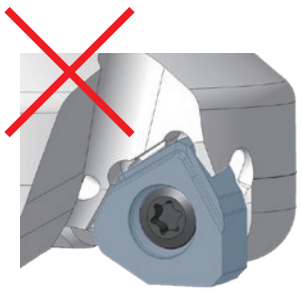

Fig.3

Wiper inserts for WWX400 are two-cornered. Please set as shown in Fig.1.
Excellent surface finish can be achieved with one wiper.
Set more than 2 wiper inserts, equally spaced, when the feed per revolution is larger than .256 IPR.
When choosing a wiper insert select a general grade that is similar to the ideal cutting conditions.

Note 1) To discharge chips effectively, use an air blow when machining. When the air blow is less effective at discharging chips, we recommend wet cutting.
Note 2) When large vibration occurs, reduce the cutting conditions.
Note 3) For interrupted cutting, reduce the cutting speed and feed rate by 20%.
Note 4) If ap is set at .079" or more, avoid machining on the walls or ramping.

Note 1) To dischage chips effectively, use an air blow when machining. When the air blow is less effective at discharging chips, we recommend wet cutting.
Note 2) When large vibration occurs, reduce the cutting conditions.
Note 3) For interrupted cutting, reduce the cutting speed and feed rate by 20%.
Note 4) If ap is set at .079" or more, avoid machining on the walls or ramping.

*Shows the distance until a maximum depth of cut of .315" is achieved at the maximum ramping angle L (= .315"/tan α).
Note 1) When ramping and helical milling, it is recommended to reduce the feed per tooth.
Note 2) When ramping and helical milling, long continuous chips may be scattered so please be careful.
Note 3) WWX200 cannot be used for ramping or helical machining.

<Helical Milling>
To obtain a flat bottom surface when helical milling, it requires to remove "the uncut part" in the center of the workpiece material at a final pass.
When helical milling, make sure that the depth of cut per helical pass doesn't exceed the maximum depth of cut (**APMX**).

INSTRUCTIONS FOR USING INSERTS

■ INSTRUCTIONS FOR USE OF THE JP BREAKER

- The JP breaker has sharp cutting edges. Wear gloves when handling.
- When machining aluminum alloy, welding to the cutting edge tends to occur, often leading to insert failure. To prevent this, wet cutting is recommended.

■ INSTRUCTIONS FOR USE OF WIPER INSERTS

- Wiper inserts for the ASX400 are single-cornered.
- When installing the wiper insert, place the insert so that the small chamfer is located as shown.

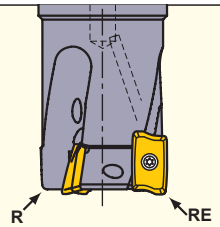
Note 1) For large R inserts
APX offers various nose radii for inserts, however one holder can not secure every insert radius.
We offer A-Holders that properly secures up to .079" radius.
We offer B-Holders that secures .094", .118" and .126" radius, only for popular inch sizes.
Customers may modify holders as below, so that larger nose radii can be secured.

Note on Use of Inserts with Large Corner Radii

When using inserts with corner radius RE≥R.094", please machine the holder with a radius form as shown on the right table.



RE	R
.094"	.106" (B-Holder)
.118"	
.126"	

R : Holder End Radius
RE : Insert Corner Radius

Or additional B-Holders are available as non stock, produced to order only.
"Order numbers"; Please add "B" to the end of the order number of A-Holders.

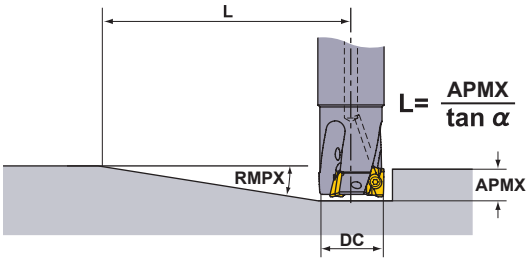
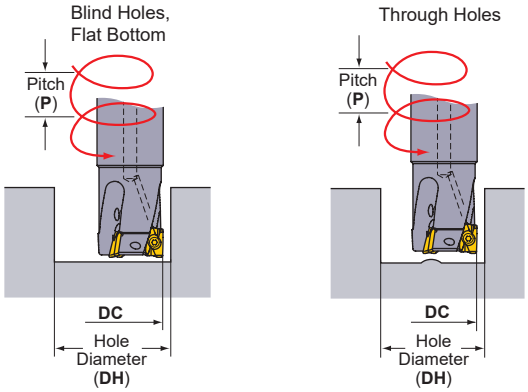
Note 1) These cutting conditions are a guide to the standard shank type and the arbor type.
Please make adjustments according to the machining conditions.
Note 2) Vibration is liable to occur in certain cases. Please reduce the depth of cut and / or reduce cutting conditions in the following cases.
• When using the long shank type and extra long shank type.
• When using long tool overhang with the standard or arbor type.
• When the application has poor clamping rigidity or when using a low rigidity machine.
Note 3) In case of coarse and fine pitch cutters, the coarse pitch type is recommended to prevent vibration.
Note 4) For heavy interrupted and unstable cutting, the H breaker is first recommendation.

■ RAMPING/HELICAL MILLING

● **Ramping**



● **Helical Milling**



Refer to the table below when using .031 inch radius for maximum ramping angle, pitch and minimum/maximum hole diameter. Use cutting conditions for slot milling to calculate speed and feed when ramping / helical milling.

Cutting Edge Diameter **DC** (inch)	Ramping		Helical Milling (Blind Hole, Flat Bottom)				Helical Milling (Through Hole)	
	Maximum Ramping Angle **RMPX**	Minimum Distance *1 **L** (inch)	Maximum Hole Diameter *2 **DH max.** (inch)	Maximum Pitch **P max.** (inch)	Minimum Hole Diameter **DH min.** (inch)	Maximum Pitch **P max.** (inch)	Minimum Hole Diameter **DH min.** (inch)	Maximum Pitch **P max.** (inch)
.500	6.0°	3.8	0.92	.09	.87	.07	.63	.020
.625	11.5°	1.9	1.17	.35	1.1	.27	.79	.079
.750	7.5°	3.0	1.42	.19	1.35	.17	1.03	.079
1.000	4.5°	5.0	1.92	.23	1.85	.19	1.58	.079
1.250	3.1°	7.3	2.42	.17	2.35	.15	2.05	.079
1.500	2.3°	9.8	2.92	.15	2.85	.13	2.56	.079
2.000	1.6°	14.1	3.92	.07	3.85	.07	3.55	.079
2.500	1.3°	17.4	4.92	.07	4.85	.07	4.56	.079
3.000	1.0°	22.6	5.92	.07	5.85	.07	5.52	.079

*1 L(=.394"/tanα). Cutters' moving distance until depth of cut reaches .394" at a maximum ramping angle.
*2 In case corner radius of .031". Other than that, find with the below formula.
{(cutting edge diameter DC) - (corner radius) - .008"} x 2
Note 1) When machining highly ductile materials with ramping angles above, chips could be continuous.
In this case, decrease the ramping angle or feed per tooth.

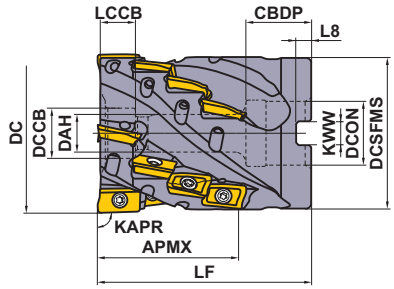
Y=Yes, N=No ★ Clamp Torque (lbf-in) : TPS25=8.9, TPS25-1=8.9

Note 1) When using inserts with corner radius RE≥ .094", machining of the holder is required as shown on page K161.

Note 2) Corner radius RE .031" is recommended for the peripheral cutting edges except the bottom cutting edge (end cutting). Insert RE .008" and .016" can also be used.



Right hand tool holder only.

DC	Set Bolt	Geometry
ϕ40mm	HSC08040	
ϕ50mm	HSC10445	

The bore diameter (DCON) is equivalent to a metric size.

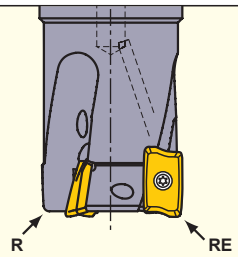
Note 1) For large R inserts
APX offers various nose radii for inserts, however one holder can not secure every insert radius.
We offer A-Holders that properly secures up to .079" radius.
We offer B-Holders that secures .126" and .157" radius, only for popular inch sizes.
Customers may modify holders as below, so that larger nose radii can be secured.

● : USA Stock ★ : Stocked in Japan
<10 inserts in one case>

Note on Use of Inserts with Large Corner Radii

When using inserts with corner radius RE≥R.126", please machine the holder with a radius form as shown on the right table.



RE	R
.126"	.098" B-Holders
.157"	
.197"	.197" C-Holders
.250"	

R : Holder End Radius
RE : Insert Corner Radius

Or additional B-Holders and C-Holders are available as non stock, produced to order only.
"Order numbers"; Please replace the last letter "A" of A-Holders to "B" or "C".
In case of screw-in holders, please add "B" or "C" to the end of the order number of A-Holders.
Ex) APX4000R08007CA→APX4000R08007CC

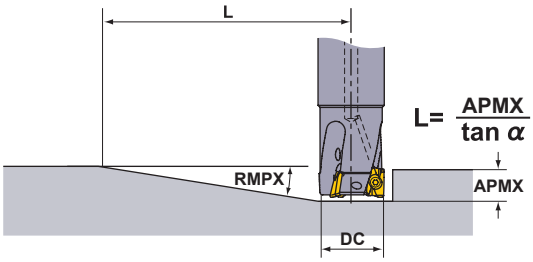
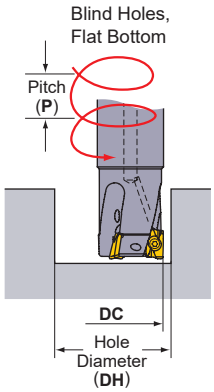
Note 1) These cutting conditions are a guide to the standard shank type and the arbor type.
Please make adjustments according to the machining conditions.
Note 2) Vibration is liable to occur in certain cases. Please reduce the depth of cut and / or reduce cutting conditions in the following cases.
• When using the long shank type and extra long shank type.
• When using long tool overhang with the standard or arbor type.
• When the application has poor clamping rigidity or when using a low rigidity machine.
Note 3) In case of coarse and fine pitch cutters, the coarse pitch type is recommended to prevent vibration.
Note 4) For heavy interrupted and unstable cutting, the H breaker is first recommendation.

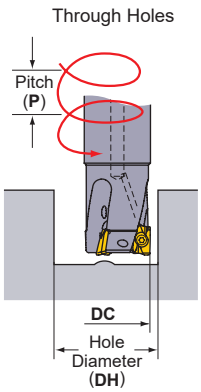
■ Ramping / Helical Milling

● **Ramping**



● **Helical Milling**





Refer to the table below when using .031 inch radius for maximum ramping angle, pitch and minimum/maximum hole diameter. Use cutting conditions for slot milling to calculate speed and feed when ramping / helical milling.

Cutting Edge Diameter **DC** (inch)	Ramping		Helical Milling (Blind Hole, Flat Bottom)				Helical Milling (Through Hole)	
	Maximum Ramping Angle **RMPX**	Minimum Distance *1 **L** (inch)	Maximum Hole Diameter *2 **DH max.** (inch)	Maximum Pitch **P max.** (inch)	Minimum Hole Diameter **DH min.** (inch)	Maximum Pitch **P max.** (inch)	Minimum Hole Diameter **DH min.** (inch)	Maximum Pitch **P max.** (inch)
.750	14°	2.7	1.42	.51	1.31	.43	.80	.019
1.000	11°	3.4	1.92	.55	1.81	.47	1.30	.157
1.250	7°	5.4	2.42	.43	2.31	.39	1.80	.196
1.500	7°	5.4	2.92	.51	2.81	.47	2.30	.275
2.000	4°	9.4	3.92	.39	3.81	.39	3.30	.275
2.500	2°	18.8	4.92	.23	4.81	.23	4.30	.157
3.000	2°	18.8	5.92	.31	5.81	.27	5.30	.236
4.000	1.5°	25.1	7.92	.31	7.81	.27	7.30	.236

*1 L(=.591"/tanα). Cutters' moving distance until depth of cut reaches .591" at a maximum ramping angle.
*2 In case corner radius of .031". Other than that, find with the below formula.
{(cutting edge diameter DC) - (corner radius) - .008"} x 2
Note 1) When machining highly ductile materials with ramping angles above, chips could be continuous.
In this case, decrease the ramping angle or feed per tooth.

Note 1) The above cutting conditons are determined based on high rigidity machine and workpiece material, where no vibration occurred.
Please adjust processing conditions if the vibration is generated.

OPERATIONAL GUIDANCE

- Use only specified inserts and parts.
- Clamp the inserts at a specified torque of only.
- The maximum spindle speeds **RPMX** are shown in Table 1. Ensure that the cutter operates under the maximum spindle speed **RPMX**.
  The maximum spindle speeds **RPMX** for safety purposes are determined in accordance with ISO15641 (Milling Cutters for high speed machining–Safety requirements).

(Table 1) Maximum Spindle Speed RPMX

Cutting Edge Diameter **DC**	ϕ.500"	ϕ.625"	ϕ.750"	ϕ1.000"	ϕ1.250"	ϕ1.500"	ϕ2.000"	ϕ2.500"	ϕ3.000"	ϕ4.000"

Note 1) These cutting conditions should be referenced for standard shank types (last letter in designation is S) and arbor shank types. If there is chatter, insert chipping, etc. during machining, alter conditions accordingly.
Note 2) Chattering vibration is more likely under the following circumstances. Use a cut and feed per tooth that are at minimum recommended conditions or below.
- When tool overhang is long (using a long shank, screw-in type, etc.)
- Rigidity of machine, workpiece material or attachment of workpiece material is low
- Corner radius during pocket milling

Note 3) A type with fewer teeth is recommended when the depth of cut in the radius direction (ae) is .5 DC or more.
Note 4) Wet cutting is recommended, when focusing on the surface finish. (Tool life is shorter than for dry cutting.)
Note 5) When using under higher than recommended cutting conditions, or for long periods of time, the clamp screw may become fatigued and break during machining. Please change out the clamp screw periodically.

Note 1) These cutting conditions should be referenced for standard shank types (last letter in designation is S) and arbor shank types. If there is chatter, insert chipping, etc. during machining, alter conditions accordingly.
Note 2) Chattering vibration is more likely under the following circumstances. Use a cut and feed per tooth that are at minimum recommended conditions or below.
- When tool overhang is long (using a long shank, screw-in type, etc.)
- Rigidity of machine, workpiece material or attachment of workpiece material is low
- Corner radius during pocket milling

Note 3) A type with fewer teeth is recommended when the depth of cut in the radius direction (ae) is .5 DC or more.
Note 4) Wet cutting is recommended, when focusing on the surface finish. (Tool life is shorter than for dry cutting.)
Note 5) When using under higher than recommended cutting conditions, or for long periods of time, the clamp screw may become fatigued and break during machining. Please change out the clamp screw periodically.

Note 1) These cutting conditions should be referenced for standard shank types (last letter in designation is S) and arbor shank types. If there is chatter, insert chipping, etc. during machining, alter conditions accordingly.
Note 2) Chattering vibration is more likely under the following circumstances. Use a cut and feed per tooth that are at minimum recommended conditions or below.
- When tool overhang is long (using a long shank, screw-in type, etc.)
- Rigidity of machine, workpiece material or attachment of workpiece material is low
- Corner radius during pocket milling

Note 3) A type with fewer teeth is recommended when the depth of cut in the radius direction (ae) is .5 DC or more.
Note 4) Wet cutting is recommended, when focusing on the surface finish. (Tool life is shorter than for dry cutting.)
Note 5) When using under higher than recommended cutting conditions, or for long periods of time, the clamp screw may become fatigued and break during machining. Please change out the clamp screw periodically.

				✲	≤.197	.002—.003	≤.197	.002—.003

Note 1) These cutting conditions should be referenced for standard shank types (last letter in designation is S) and arbor shank types. If there is chatter, insert chipping, etc. during machining, alter conditions accordingly.
Note 2) Chattering vibration is more likely under the following circumstances. Use a cut and feed per tooth that are at minimum recommended conditions or below.
- When tool overhang is long (using a long shank, screw-in type, etc.)
- Rigidity of machine, workpiece material or attachment of workpiece material is low
- Corner radius during pocket milling

Note 3) A type with fewer teeth is recommended when the depth of cut in the radius direction (ae) is .5 DC or more.
Note 4) Wet cutting is recommended, when focusing on the surface finish. (Tool life is shorter than for dry cutting.)
Note 5) When using under higher than recommended cutting conditions, or for long periods of time, the clamp screw may become fatigued and break during machining. Please change out the clamp screw periodically.

Note 1) When machining a highly ductile workpiece material with the ramping angles in the table above, chips may be elongated.
* Shows the distance until a maximum depth of cut of .315" is achieved at the maximum ramping angle L (= .315"/tan α).

For Plunging and Drilling

See the tables to the right for cutting conditions. Follow the cutting conditions for slot milling regarding feed per tooth and cutting speed.

● Plunging

(inch)

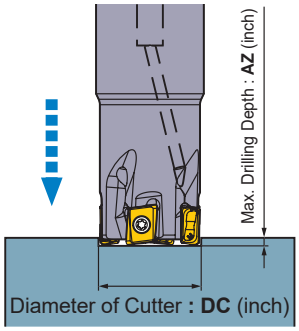
DC	ae max.
.625	.154
.750	.154
.875	.157
1.000	.157
1.125	.157
1.250	.157
1.375	.157
1.500	.157
2.000	.157
2.500	.157

Note 1) No step feed necessary.

● Drilling



(inch)

DC	AZ max.
.625	.012
.750	.012
.875	.012
1.000	.012
1.125	.012
1.250	.012
1.375	.012
1.500	.012
2.000	.012
2.500	.012

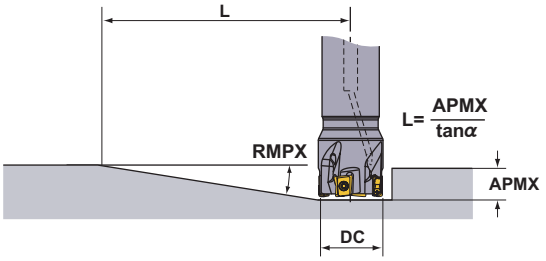
Note 1) Exercise due caution as chips scatter easily.
Note 2) Use compressed air to eliminate chips
(or coolant for when machining aluminum alloy).

VPX300 Including long types for deep cutting

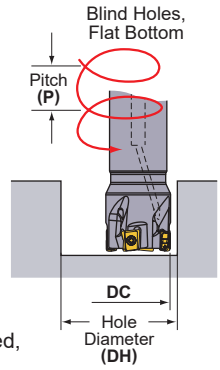
RECOMMENDED CUTTING CONDITIONS

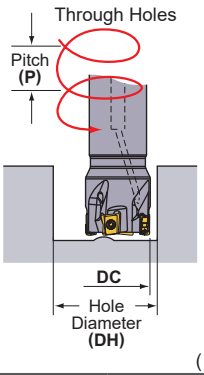
Ramping / Helical Milling

● Ramping



● Helical Milling





Refer to the table below for cutting conditions. For feed per tooth and cutting speed, follow the cutting conditions for slot milling.

(inch)

Cutting Edge Diameter DC	RE	Ramping		Helical Milling (Blind Hole, Flat Bottom)				Helical Milling (Through Hole)	
		Maximum Ramping Angle RMPX	Minimum * Distance L	Maximum Hole Diameter DH max.	Maximum Pitch P max.	Minimum Hole Diameter DH min.	Maximum Pitch P max.	Minimum Hole Diameter DH min.	Maximum Pitch P max.

Note 1) The maximum spindle speeds are set to ensure tool and insert stability.
Before operating this tool read the operation guidance on page K256.
Note 2) When using the tool at high spindle speeds, ensure that the tool and arbor are correctly balanced.
Note 3) Note for insert with a corner radius of .063" and above, as corner radius increases the LF and LH dimension decreases.

Note 1) The maximum spindle speeds are set to ensure tool and insert stability.
Before operating the tool read the operation guidance on page K256.
Note 2) When using the tool at high spindle speeds, ensure that the tool and arbor are correctly balanced.
Note 3) Note for insert with a corner radius of .063" and above, as corner radius increases the LF dimension decreases.
Note 4) Set bolt not included.

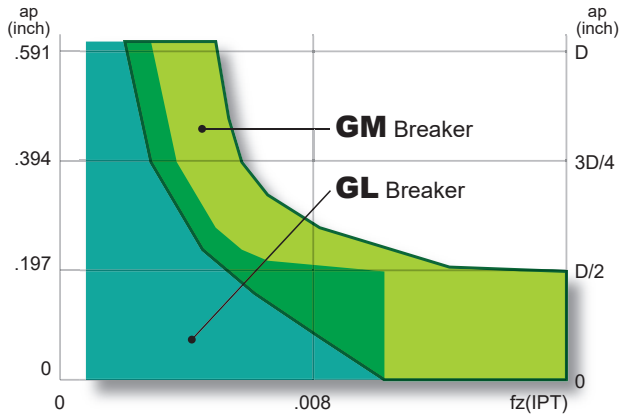
<10 inserts in one case>

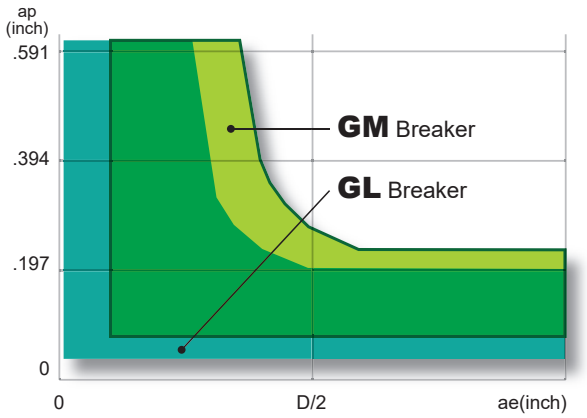
Selection of insert

It is necessary to choose the best insert according to the cutting conditions. Please select an insert from the tables below.
1st recommendation for stable cutting condition is the GL breaker with a strong cutting edge.

Selection of insert according to the feed per tooth and the required cutting depth



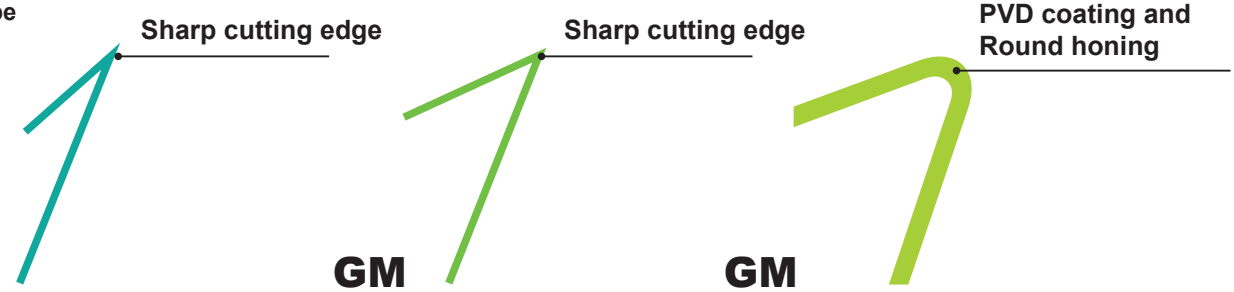
Selection of insert according to the width of cut and the required cutting depth



1st recommendation for machining aluminum alloys is GL breaker.
Under high-load conditions such as deep or high feed cutting, it is advisable to use the GM breaker.

Selection of insert according to cutting edge

Insert type

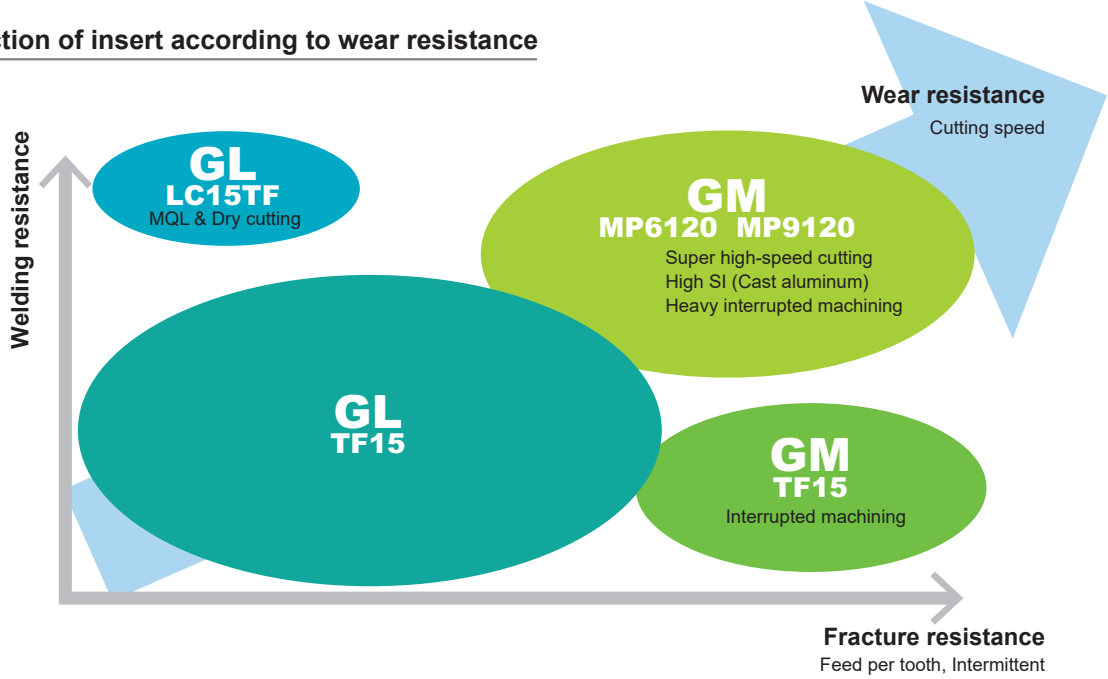


GL
TF15/LC15TF
Low cutting resistance
(LC15TF: Excellent weld resistance)

GM
TF15
Tougher cutting edge

GM
MP9120
Tougher cutting edge & wear resistance
Machining of difficult-to-cut materials & aluminum

Selection of insert according to wear resistance



RECOMMENDED CUTTING CONDITIONS

■Cutting Speed

				DC (Slot)	≤ .197	≤ .002	≤ .004	≤ .005	≤ .005	≤ .006	≤ .006

Note 1) The above cutting conditions are determined based on high workpiece and machine rigidity, where no vibration occurred. If vibrations occur make adjustments according to the machining conditions.

Note 2) Note, vibrations may occur in the following conditions.
- When using long tool overhang.
- When pocket machining corner radii.
- When the workpiece has poor clamping rigidity or when the machine rigidity or workpiece rigidity is low, vibrations can occur easily, if so, reduce cutting conditions such as width and depth of cut and feed per tooth.

Note 1) The above cutting conditions are determined based on high workpiece and machine rigidity, where no vibration occurred.
If vibrations occur make adjustments according to the machining conditions.

Note 2) Note, vibrations may occur in the following conditions.
- When using long tool overhang.
- When pocket machining corner radii.
- When the workpiece has poor clamping rigidity or when the machine rigidity or workpiece rigidity is low, vibrations can occur easily, if so, reduce cutting conditions such as width and depth of cut and feed per tooth.

		.197	2.1°	15.91	9.571	.354	9.577	.354	9.259	.354

The recommended ramping or helical cutting feed is .002 IPT or less.

*1 Using the maximum ramping angle, the distance to reach the maximum depth of cut is as follows:
L=(maximum depth of cut APMX / tan α). Maximum depth of cut A type is .610", B type is .583".

*2 The maximum diameter when machining a blind hole with a flat face using a corner radius of .047".

*3 The maximum diameter when machining a blind hole with a flat face using a corner radius of .094".

*4 The maximum diameter when machining a blind hole with a flat face using a corner radius of .125".
For other corner radius, use to following formula. {(cutting edge diameter DC) - (corner radius RE) - β} ×2

DC	β
1.0" — 1.25"	.010"
1.5"—5.0"	.018"

■ Max. Drilling Depth (Aluminum Alloy)

(inch)

Type	RE	Max.Drilling Depth			
		ϕ.787"	ϕ1.000"	ϕ1.250"	ϕ1.500"—ϕ5.000"
A Type	.016—.047	.209	.205	.205	.209
	.063—.094	.189	.181	.185	.189
	.118—.125	.169	.146	.165	.173
B Type	.157	.146	.106	.142	.150
	.197	.134	.091	.130	.138

The recommended drilling feed is .002 IPT or less.

AXD4000 can be effectively used for pocket machining without the need for a prepared hole.

For safety reasons, clamping screws must be replaced at the same time as inserts.

Note 1) Use the GM type insert when using with a high-speed, high-power spindle machine that is the ideal choice for AXD4000A (spindle RPM of 20000 min^{-1} or more, motor power of 80 kw or more).

Note 2) Clamp screw and wrench of AXD4000A are different from AXD4000.

Note 3) For insert dimensions, refer to page K242.

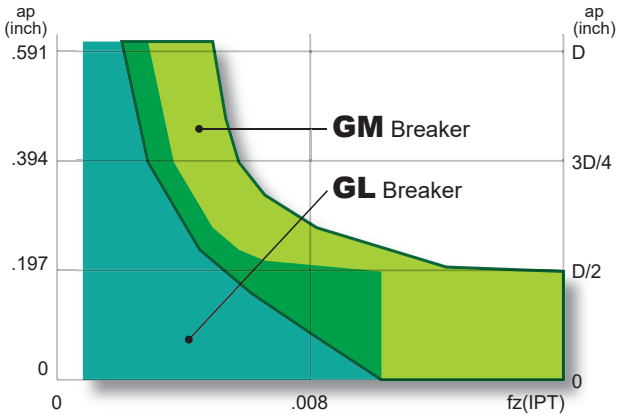
□ : Non stock, produced to order only.

Please order in the ① insert kit order number and ② insert grades.

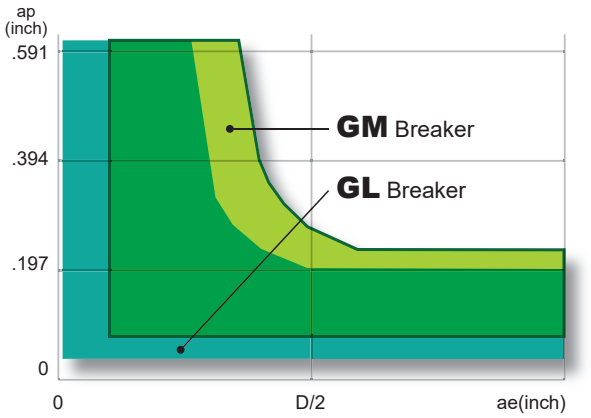
Selection of insert

It is necessary to choose the best insert according to the cutting conditions. Please select an insert from the tables below. The first recommendation for efficient, high load machining with a high-speed spindle is the GM breaker with a strong cutting edge.

Selection of insert according to the feed per tooth and the required cutting depth

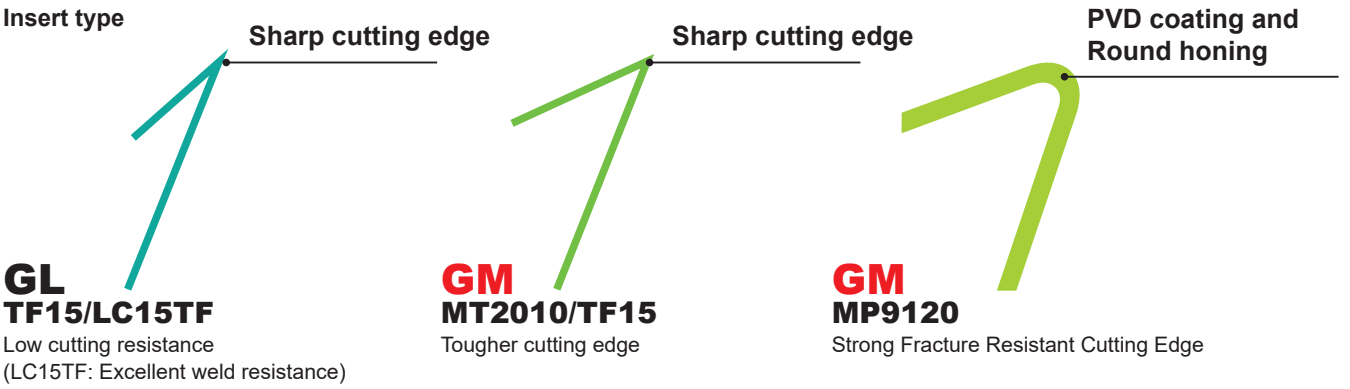


Selection of insert according to the width of cut and the required cutting depth

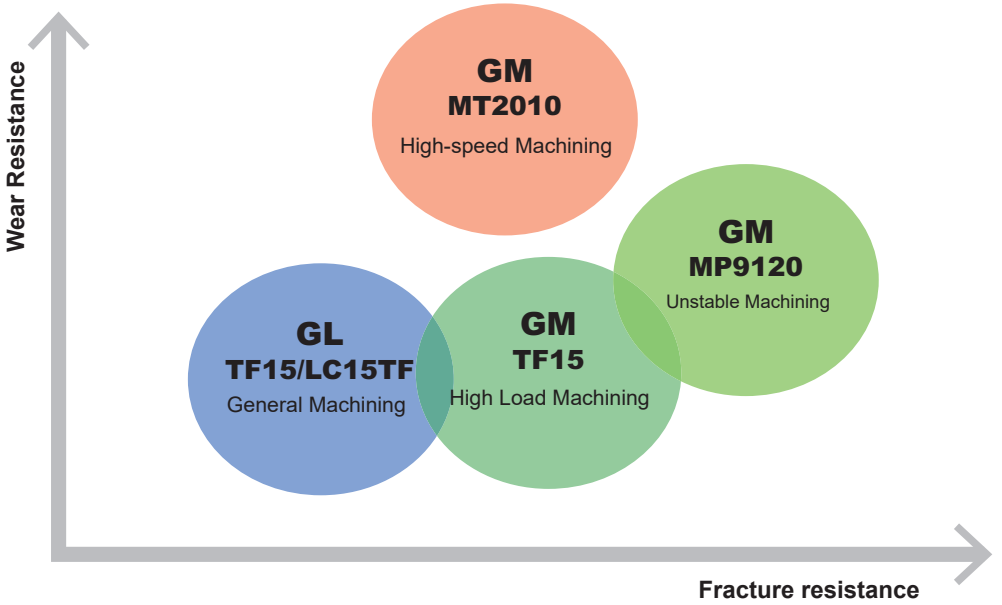


1st recommendation for machining aluminum alloys is GL breaker.
Under high-load conditions such as deep or high feed cutting, it is advisable to use the GM breaker.

Selection of insert according to cutting edge



Selection of insert according to wear resistance



RECOMMENDED CUTTING CONDITIONS

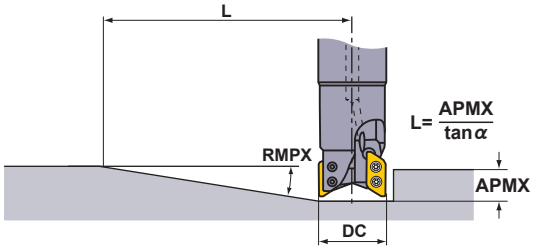
(inch)

	Workpiece Material	Properties	Grade	Breaker	Cutting Speed **vc** (SFM)	Cutting Width **ae**	Depth of Cut **ap**	Feed per Tooth (IPT)
N	Aluminum Alloys	Content Si<5%	MT2010 TF15 MP9120	**GM**	13120(6560—16500)	≤.5 DC	≤ .197	≤ .014
							≤ .394	≤ .012
							≤ .571	≤ .010
						≤.75 DC	≤ .197	≤ .012
							≤ .394	≤ .010
							≤ .571	≤ .008
						DC (Slot)	≤ .197	≤ .012
			TF15 LC15TF	**GL**	13120(6560—16500)	≤.75 DC	≤ .197	≤ .008
							≤ .394	≤ .006
							≤ .571	≤ .004
						DC (Slot)	≤ .197	≤ .008

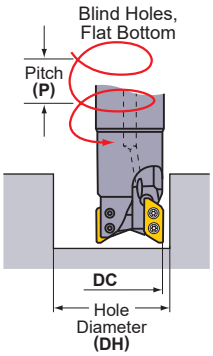
Note 1) The above cutting conditions are determined based on high workpiece materials and machine rigidity, where no vibration occurred. If vibrations occur make adjustments according to the machining conditions.
Note 2) Note, vibrations may occur in the following conditions.
- When using long tool overhang.
- When pocket machining corner radii.
- When the workpiece materials has poor clamping rigidity or when the machine rigidity or workpiece materials rigidity is low, vibrations can occur easily, if so, reduce cutting conditions such as width and depth of cut and feed per tooth.

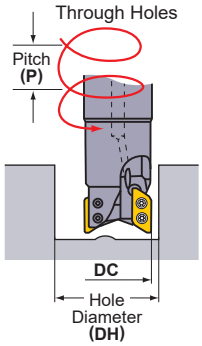
■ Ramping / Helical Milling / Drilling

● **Ramping**



● **Helical Milling**





Refer to the table below for cutting conditions. For feed per tooth and cutting speed, follow the cutting conditions for slot milling.

(inch)

DC inch	DC mm	Type	Insert Corner R **RE**	Ramping: Max. Ramping Angle **RMPX**	Ramping: Min. Distance *1 **L**	Helical Milling (Blind Hole, Flat Bottom): Max. Hole Diameter **DH max.**	Max. Pitch **P max.**	Min. Hole Diameter **DH min.**	Max. Pitch **P max.**	Helical Milling (Through Hole): Min. Hole Diameter **DH min.**	Max. Pitch **P max.**	Drilling

			.197	5.8°	5.748	3.512	.354	3.496	.354	3.197	.354	.142
2.000	50.8	D	.016–.047	8.7°	4.016	3.874 *2	.551	3.819	.551	3.260	.551	.217
			.063–.094	8.2°	4.252	3.780 *3	.512	3.748	.512	3.260	.512	.197
			.118–.126	7.6°	4.606	3.717 *4	.472	3.685	.472	3.260	.472	.177
		E	.157	6.9°	4.843	3.654	.394	3.606	.394	3.260	.394	.154
			.197	6.5°	5.118	3.575	.354	3.559	.354	3.260	.354	.142

*1 Using the maximum ramping angle, the distance to reach the maximum depth of cut is as follows: L= (maximum depth of cut APMX/tan α). Maximum depth of cut D type is .610", E type is .583".
*2 Corner radius of .047". For other corner radii, use the following formula. {(cutting edge diameter DC)—(corner radius RE)– .022"}×2
*3 Corner radius of .094". For other corner radii, use the following formula. {(cutting edge diameter DC)—(corner radius RE)– .022"}×2
*4 Corner radius of .126". For other corner radii, use the following formula. {(cutting edge diameter DC)—(corner radius RE)– .022"}×2
Note 1) The recommended ramping feed is .002 IPT or under.

Note 1) The above cutting conditions are determined based on high workpiece material and machine rigidity, where no vibration occurred. If vibrations occur make adjustments according to the machining conditions.

Note 2) Note, vibrations may occur in the following conditions.

- When using long tool overhang.
- When pocket machining corner radii.
- When the workpiece has poor clamping rigidity or when the machine rigidity or workpiece rigidity is low, vibrations can occur easily, if so, reduce the cutting conditions.

	5.000	.157	9.016	.433
		.197	9.016	.433

Note 1) The recommended ramping feed is .002 IPT or under.

*1 L (Max. Depth of Cut =.591" / tan α). Cutters' moving distance until depth of cut reaches APMX at a maximum ramping angle.
Maximum depth of cut A type is .827", B type is .803".

*2 The maximum diameter when machining a blind hole with a flat face using a corner radius of .031" for A type and .157" for B type.
Other than that, find with the below formula.
{(cutting edge diameter DC)—(corner radius)—0.3)}×2

*3 The minimum diameter when machining a blind hole with a flat face using a corner radius of .031" for A type and .157" for B type.
Other than that, find with the below formula.
{(cutting edge diameter DC)—(corner radius)—(Width of wiper edge BS)—0.1)}×2

■Max. Drilling Depth (Aluminum Alloys)

(inch)

Type	RE	Max. Drilling Depth
A Type	.031—.094	.197
	.118, .126	.177
B Type	.157	.157
	.197	.138

AXD7000 can be effectively used for pocket machining without the need for a prepared hole.

∗2 The maximum diameter when machining a blind hole with a flat face using a corner radius of .031" for A type and .157" for B type. Other than that, find with the below formula.
{(cutting edge diameter DC)−(corner radius)−0.3)}×2

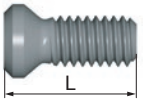
∗3 The minimum diameter when machining a blind hole with a flat face using a corner radius of .031" for A type and .157" for B type. Other than that, find with the below formula.
{(cutting edge diameter DC)−(corner radius)−(Width of wiper edge BS)−0.1)}×2

Note 1) The recommended ramping feed is .002 IPT or under.

OPERATIONAL GUIDANCE

Only use the inserts and parts provided by Mitsubishi Materials with this tool. Use of the correct insert clamp screws is especially important to ensure overall tool safety. Do not use damaged or worn clamp screws.

Type	AXD4000		AXD7000	
Cutting Edge Diameter **DC**(inch)	ø.787"	ø1.000"–ø5.000"	ø1.250"	ø1.500"–ø5.000"
Clamp Screw Number	TS3SBS	TS3SB	TS4SB	TS4SBL
Overall Length **L**(inch)	.256	.315	.353	.413
Clamp Torque (lbf-in)	13	13	31	31



When tightening the clamp screws, follow the order in Figure 1.
The maximum allowable spindle speeds are shown in Table 1.
Ensure that the cutter operates under the maximum allowable spindle speed.
The maximum allowable spindle speeds for safety purposes are determined in accordance with ISO15641 (Milling Cutters for high speed machining–Safety requirements).

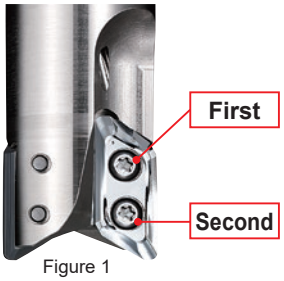


Figure 1

(Table 1) Maximum allowable spindle speed

AXD4000

Cutting Edge Diameter **DC**(inch)	ø.787"	ø1.000"	ø1.250"	ø1.500"	ø2.000"	ø2.500"	ø3.000"	ø4.000"	ø5.000"
Max. Allowable Spindle Speed (min^{-1})	15000	49000	48000	41000	35000	30000	27000	23000	20000

AXD7000

Cutting Edge Diameter **DC**(inch)	ø1.250"	ø1.500"	ø2.000"	ø2.500"	ø3.000"	ø4.000"	ø5.000"
Max. Allowable Spindle Speed (min^{-1})	41000	36000	30000	25000	23000	19000	16000

Even when operating under the maximum allowable spindle speed, if the spindle speed is equal to or higher than the values shown in table 2, it is recommended that the balance quality (with the arbor or milling chuck) conforms to G6.3 or better based on ISO1940. It is also recommended to replace the clamp screws with new ones when changing inserts. Furthermore, ensure to use machines that are provided with safety measures in case of cutter breakage.
∗ The balance quality of the holder (without inserts and clamp screws) is G6.3 or better at 10000 min^{-1}.

(Table 2) Maximum spindle speed when balancing with the arbor or milling chuck has not been achieved

AXD4000

Cutting Edge Diameter **DC**(inch)	ø.787"	ø1.000"	ø1.250"	ø1.500"	ø2.000"	ø2.500"	ø3.000"	ø4.000"	ø5.000"
Max. Spindle Speed (min^{-1})	15000	12000	9500	7600	6000	4800	3800	3000	2400

AXD7000

Cutting Edge Diameter **DC**(inch)	ø1.250"	ø1.500"	ø2.000"	ø2.500"	ø3.000"	ø4.000"	ø5.000"
Max. Spindle Speed (min^{-1})	9500	7600	6000	4800	3800	3000	2400

When setting the spindle speed, take into consideration the maximum allowable spindle speed of the arbor or milling chuck.
Use the specified set bolt when using the arbor type with through coolant.
The inserts have sharp cutting edges and handling them with bare hands may cause injuries. Always wear safety gloves when handling the indexable inserts.

✶1 Clamp Torque (lbf-in) : TS4SL=35 ✶2 RMPX : Max. Ramping Angle

Note 1) You need to balance the tool and holder together so that it confirms to G40 or higher standards.

OPERATIONAL GUIDANCE

Only use the inserts and parts provided by Mitsubishi Materials with this tool. Use of the correct insert clamp screws is especially important to ensure overall tool safety. Do not use damaged or worn clamp screws.

- When tightening the clamp screws, follow the order in Figure 1.
- The maximum allowable spindle speeds are shown in Table 1. Ensure that the cutter operates under the maximum allowable spindle speed.
  The maximum allowable spindle speeds for safety purposes are determined in accordance with ISO15641 (Milling Cutters for high speed machining–Safety requirements).

(Table 1) Maximum allowable spindle speed

Cutting Edge Diameter **DC**(inch)	ø.750"	ø.950"	ø1.100"	ø1.250"	ø1.350"	ø1.500"	ø2.000"	ø2.500"	ø3.000"	ø4.000"	ø5.000"
Max. Allowable Spindle Speed (min^{-1})	15000※	38000	35000	33000	31000	29000	24000	21000	19000	16000	14000

※ø20 mm with one tooth balancing is necessary to adjust sensitively.

- Even when operating under the maximum allowable spindle speed, if the spindle speed is equal to or higher than the values shown in table 2, it is recommended that the balance quality (with the arbor or milling chuck) conforms to G40 or better based on ISO1940. It is also recommended to replace the clamp screws with new ones when changing inserts. Furthermore, ensure to use machines that are provided with safety measures in case of cutter breakage.

✶ The balance quality of the holder (without inserts and clamp screws) is G40 or better at 10000 min^{-1}.

(Table 2) Maximum spindle speed when balancing with the arbor or milling chuck has not been achieved

Cutting Edge Diameter **DC**(inch)	ø.750"	ø.950"	ø1.100"	ø1.250"	ø1.350"	ø1.500"	ø2.000"	ø2.500"	ø3.000"	ø4.000"	ø5.000"
Max. Spindle Speed (min^{-1})	15000	12000	10800	9500	8700	7600	6000	4800	3800	3000	2400

- When setting the spindle speed, take into consideration the maximum allowable spindle speed of the arbor or milling chuck.
- Use the specified set bolt when using the arbor type with through coolant.
- The inserts have sharp cutting edges and handling them with bare hands may cause injuries. Always wear safety gloves when handling the indexable inserts.

RECOMMENDED CUTTING CONDITIONS

(inch)

	Workpiece Material	Cutting Width **ae**	Cutting Speed **vc** (SFM)	Feed per Tooth **fz** (IPT)
S	Ti Alloys Ti-6Al-4V,Ti-6Al-4V-ELI Ti-10V-2Fe-3Al Ti-5Al-5V-5Mo-3Cr etc.	ae≤0.5DC	195(165—260)	.005(.004—.006)
		0.5DC< ae< 0.8DC	165(130—195)	.004(.003—.005)
		ae≥0.8DC	130(165—195)	.003(.002—.004)

Note 1) The cutting performance depends on machine and clamping rigidity, as well as the supply and pressure of the coolant. Adjust as necessary.
Note 2) Use a machine and spindle size suitable for heavy machining of titanium alloys. (7/24 taper #50 or #60, or high-rigidity HSK-A100 or A125, with an output of 20.1 HP/bhp or higher and torque of 4425 lbf-in or higher for a rotation speed of 500min-1 or less).
Note 3) If chatter and vibration or machine overloading occur, it is recommended to reduce the depth of cut ap.
Note 4) The coolant system combines internal and external lubrication, it is recommended to supply coolant in ample quantities.
Note 5) A gradual roll feed into the workpiece and use of down cutting is recommended. (refer to page K267)

● : USA Stock
(10 inserts in one case)

HOW TO USE

■Positive Effects of a Roll Into Cutting Approach

The roll into cutting approach can control sharp increases in cutting loads and prevent sudden chipping of inserts which is likely to occur at the start of machining.

Approach Method	Cutting Load Simulation	Image of Cutting Vibration Frequency
Direct Approach  	Cutting load increases suddenly. High risk of chipping. 	Roll Into Cutting Approach  	Cutting load increases smoothly. 	Almost no vibration 
Down cutting is recommended.

Note 1) The above cutting conditons are determined based on high rigidity machine and workpiece material, where no vibration occurred. Please adjust processing conditions if the vibration is generated.

Note 2) For tools with a cutting edge length of 7.87″ or more, please reduce the cutting speed and table feed by 10-20% and the width of cut by 50%.

Note 3) If the cutting angle between the tool and workpiece material exceeds 90º when machining corners ,Reduce the cutting speed and table feed by 10-20% and ae by 50%. Also if possible, set a radius cutting path for corners.

RECOMMENDED CUTTING CONDITIONS

■ Slot Milling

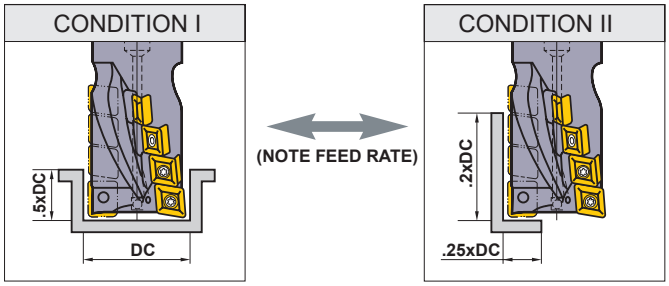
Workpiece Material		Cutting Condition Vs.Tool Diameter					Insert grade
		Spindle Speed / Feed	ϕ1"	ϕ1.25"	ϕ1.5"	ϕ2"	
P	Mild Steel (<160HB)	min^{-1}	2250	1800	1500	1100	VP15TF F7030
		inch/min	7—12	6—10	7—12	6—10	
	Carbon Steel (20HRC)	min^{-1}	2250	1800	1500	1100	
		inch/min	8—14	7—12	8—14	7—12	
	Alloy Steel (30HRC)	min^{-1}	1750	1800	1200	900	
		inch/min	6—10	5—8	6—10	5—8	
M	Stainless Steel (304)	min^{-1}	1900	1500	1250	950	VP15TF
		inch/min	3—5	2.5—4	3—5	2.5—4	
K	Gray Cast Iron (≤450MPA)	min^{-1}	1800	1250	950	650	UTi20T
		inch/min	7—9	7—9	8—10	8—10	

■ Shoulder Milling

Workpiece Material		Cutting Condition Vs.Tool Diameter					Insert grade
		Spindle Speed / Feed	ϕ1"	ϕ1.25"	ϕ1.5"	ϕ2"	
P	Mild Steel (<160HB)	min^{-1}	2250	1800	1500	1100	VP15TF F7030
		inch/min	11—18	9—15	11—18	9—15	
	Carbon Steel (20HRC)	min^{-1}	2250	1800	1500	1100	
		inch/min	12—21	11—18	12—21	11—18	
	Alloy Steel (30HRC)	min^{-1}	1750	1400	1200	900	
		inch/min	9—15	8—12	9—15	8—12	
M	Stainless Steel (304)	min^{-1}	1900	1500	1250	950	VP15TF
		inch/min	7—12	6—10	7—12	6—10	
K	Gray Cast Iron (≤450MPA)	min^{-1}	1800	1250	950	650	UTi20T
		inch/min	8—10	8—10	9.5—11	9.5—11	

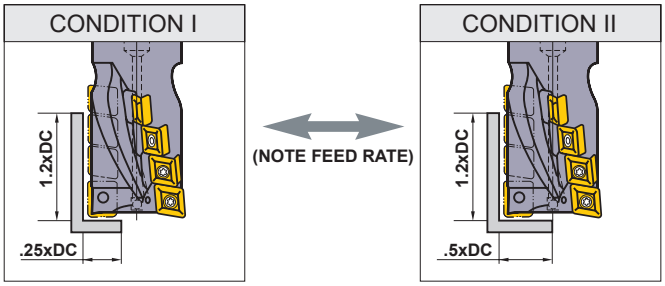
Note 1) These feed rates are for ENA and ERA inserts.
Reduce feed 25% for ENB and ERB inserts.
ENB or ERB inserts not recommended in gummy materials like stainless steel or mild steel.

■ Slot Milling
Forced air is required at cutting edge



- Use higher recommended feed rate under CONDITION I.
- Use lower recommended feed rate under CONDITION II.

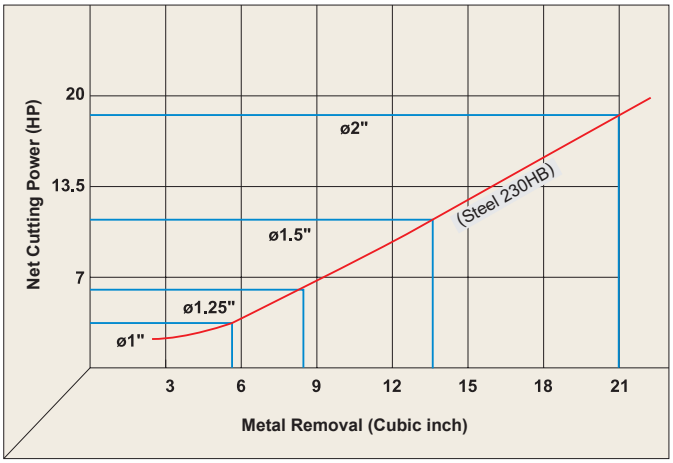
■ Shoulder Milling
Generally down cut is recommended



- Use higher recommended feed rate under CONDITION I.
- Use lower recommended feed rate under CONDITION II.

■ Net Cutting Power

- Please use the chart below for reference, please select the conditions that suits the machines power.
- Chip Discharge Q ($inch^3$/min)=Table Feed×Depth of Cut×Cutting Width÷1000



■ For Use of Long Cutting Length Type

- Since the overhang from the milling chuck is long, a large width of cut will cause chattering and tool breakage.
- Keep the width of cut small and the depth of cut in axial direction large. (See the following illustration.)
- For slot milling, keep the table feed at not more than half the value listed in the above table. (Use the standard cutting length type as much as possible.)

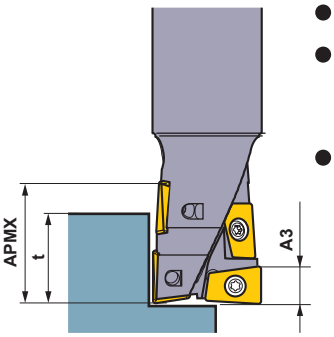
Note 1) Please pay special attention on the depth of cut when using the short edge type.
Note 2) When using the G1-breaker wiht coated grades VP15TF, MP6120 or MP9120, reduce the feed rate by 20%.
Note 3) For more information on "No.", please refer to page K281 for cutting speed.

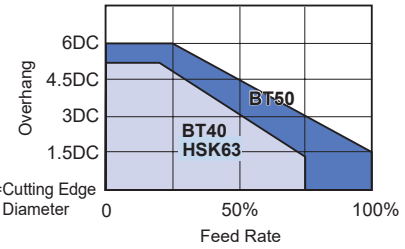


*Figures for A3 and APMX are shown in the table of holder standard.

- A3 is the depth of cut for the full dual blade portion at the end of the cutting edge.
- Beyond the range of A3 where overlapping occurs, there is an area where the cutting edge becomes single bladed, not forming full dual blade configuration.
  As such, please pay special attention to the relationship between depth of cut and feed.
- In general, the edge at the border of cut tends to suffer from damages. At large depth of cut operations, applying the following depth of cut (**t**), at which the edge is full dual bladed at the border of cut, is recommended to prevent damage to the cutting edge.

(inch)

Tool Diameter	Recommended Depth of Cut **t**
ϕ.625, .672	.472—.551
ϕ.750, .797	.551—.669
ϕ1.000, 1.047	.669—.866
ϕ1.250, 1.297	.866—1.102
ϕ1.500	1.102—1.378



- Chatter vibration and other problems tend to occur at operations where overhang length is large and/or machine rigidity is low, resulting in unstable machining.
- Please reduce feed accordingly, using the above chart as a guideline.

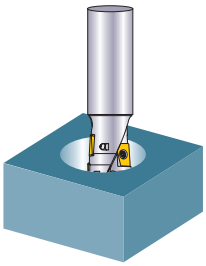
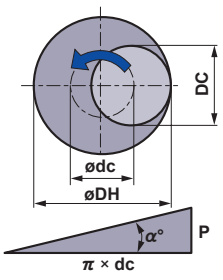
Note 1) Helical grooving is strongly recommended for machining of tempered steel.
Note 2) When using the G1-breaker wiht coated grades VP15TF, MP6120 or MP9120, reduce the feed rate by 20%.
Note 3) For more information on "No.", please refer to page K281 for cutting speed.





● How to calculate the theoretical center of the cutter path.

$$\text{Ø dc (Theoretical center of the tool)} = \text{Ø DH (Desired hole diameter)} - \text{DC (Cutting edge diameter)}$$

● Depth of cut for a pass.

$$P = \pi \times dc \times \tan\alpha^\circ \quad (*\ \alpha^\circ \leq 3^\circ)$$

● Min. machined hole diameter at helical milling : 1.2DC
Max. machined hole diameter at helical milling : 1.8DC

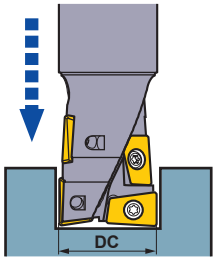
● For chip discharge, please always apply air blow.
(When aluminum cutting, please use coolant.)

● When helical milling, it is recommended to reduce the feed rate by 40%.

● When using the G1-breaker wiht coated grades VP15TF, MP6120 or MP9120, reduce the feed rate by 20%.

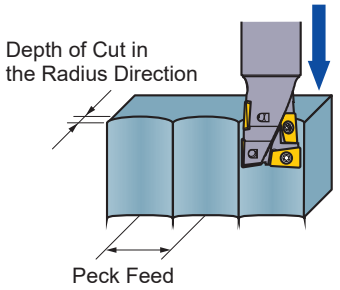
■ For Drilling and Plunging

● Drilling



- The recommended drilling depth is less than .5DC.
- Use step feed when drilling (.010－.020 inch) to ensure that the chips are effectively broken.
- Use internal or external cooling to ensure that the chips disposal is sufficiently achieved.
- The chips generated can discharge in any direction, so ensure that adequate safety precautions are taken.

● Plunging



- The feed for plunging is the same as the feed for drilling.
- No step feed necessary.
- Please refer to the following table for the depth of cut at plunging operations.

Depth of Cut in the Radius Direction	≤ .4DC
Peck Feed	≤ .5DC

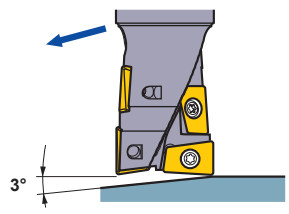
Note 1) Helical grooving is strongly recommended for machining of tempered steel.
Note 2) When using the G1-breaker wiht coated grades VP15TF, MP6120 or MP9120, reduce the feed rate by 20%.
Note 3) For more information on "No.", please refer to page K281 for cutting speed.

■ For Ramping



- When machining steel the recommended ramping angle is 3°. If a ramping angle larger than 3° is used, then the chips may not be broken effectively resulting in chips wrapping around the tool.
- When ramping, it is recommended to reduce the feed rate by 40%.

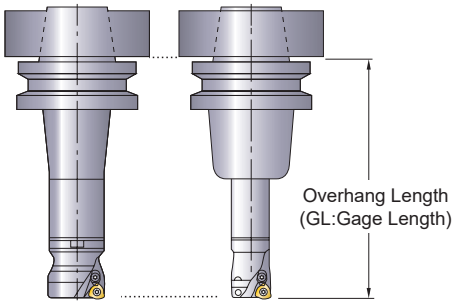
* Depth of cut of JL breaker is up to .047 inch.

①Overhang Length



②Main Spindle Speed
$n(min^{-1})=(Recommended\ Cutting\ Speed \times 12)\div(DCX \times 3.14)$

③Table Feed Rate
vf(IPM)=n x feed per tooth fz x number of teeth

④Recommended width of cut (ae) is more than 60% of cutting edge diameter.

⑤The cutting condition on the left are guide when using a CAT50 size holder. In case of CAT40 and HSK63 machines, a cutter diameter of under 1.5 inch is recommended. In this case, reduce the depth of cut and table feed rate.

⑥Use of ST chip breaker with a tougher cutting edge is recommended for interrupted cutting.

⑦A cutter body with a coarse pitch is recommended for use in unstable conditions such as a long tool overhang.

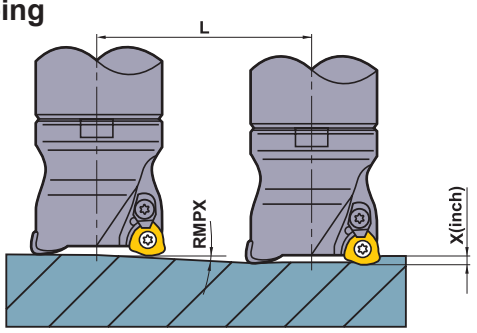
⑧Use “sharp” JM chip breaker to lower cutting forces or when there is a long tool overhang.

⑨Large chips are generated when machining with the AJX. To avoid chip jamming-related problems, machine using an air blow to disperse the chips effectively.

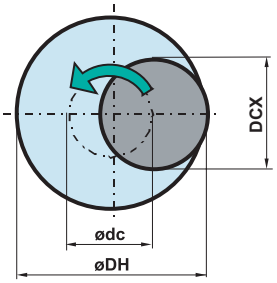
⑩The maximum depth of cut JL chip breaker is different in the insert size. 06 size is up to .024 inch, 08 size is up to .035 inch, and 09, 12, 14 size is up to .047 inch.

MAXIMUM CAPACITIES BY MODE

■ Ramping



■ Helical Milling and Drilling



- How to calculate the theoretical center of the tool path.

ødc = øDH - DCX

ødc	øDH	DCX
Theoretical Center of the Tool	Desired Hole Diameter	Cutting Diameter Max.

- Please set the depth of cut per cycle under max. depth of cut (APMX).
- Please machine in a down cutting direction.

- When ramping and helical milling, it is recommended to reduce the feed rate by 40%.
- When drilling, please set the feed in the axial direction .008 IPR or less.
- The long chips generated can discharge in any direction, so ensure that adequate safety precautions are taken.

(inch)

■Cutter Diameter and Flat Surface Milling

The maximum cutting diameter (DCX) shown in the WJX items table is not the same as the possible dimensions for plane cutting.
The possible dimensions for plane cutting are given as the cutting axle DC value. Please note that this is smaller than the DCX value.

● : USA Stock
<10 inserts in one case>

RECOMMENDED CUTTING CONDITIONS

CORRECTION VALUE ACCORDING TO OVERHANG LENGTH

Multiply the recommended cutting conditions by the corrections factor x overhang length.

(inch)

Type	Cutting Dia. Max. **DCX**	Overhang Length	Correction Value According

H			VP15TF				
	Hardened Steel	40—55HRC	230(130—330)				

Note 1) To discharge chips effectively, use an air blow when machining. When the air blow is less effective at discharging chips, we recommend wet cutting.
Note 2) When wet cutting, tool life may become shorter than dry cutting. When carrying out wet cutting for the applications recommended with dry cutting, reduce the cutting speed by 25%.
Note 3) When large vibration occurs, reduce the cutting conditions.
Note 4) For interrupted cutting, reduce the cutting speed and feed rate by 20%.

Note 1) To discharge chips effectively, use an air blow when machining. When the air blow is less effective at discharging chips, we recommend wet cutting.
Note 2) When large vibration occurs, reduce the cutting conditions.
Note 3) For interrupted cutting, reduce the cutting speed and feed rate by 20%.
Note 4) If ap is set at .079" or more, avoid machining on the walls or ramping.

Note 1) When ramping and helical milling, it is recommended to reduce the feed per tooth.
Note 2) When ramping, helical milling and drilling, long continuous chips may be scattered so please be careful.

<Helical Milling>
To obtain a flat bottom surface when helical milling, it requires to remove “the uncut part” in the center of the workpiece material at a final pass.
When helical milling, make sure that the depth of cut per helical pass doesn’t exceed the maximum depth of cut (APMX).
<Drilling>
When drilling, set the axial feed per revolution at .008 IPR or less.

Note 1) To discharge chips effectively, use an air blow when machining. When the air blow is less effective at discharging chips, we recommend wet cutting.
Note 2) When wet cutting, tool life may become shorter than dry cutting. When carrying out wet cutting for the applications recommended with dry cutting, reduce the cutting speed by 25%.
Note 3) When large vibration occurs, reduce the cutting conditions.
Note 4) For interrupted cutting, reduce the cutting speed and feed rate by 20%.

Note 1) When ramping and helical milling, it is recommended to reduce the feed per tooth.
Note 2) When ramping, helical milling and drilling, long continuous chips may be scattered so please be careful.

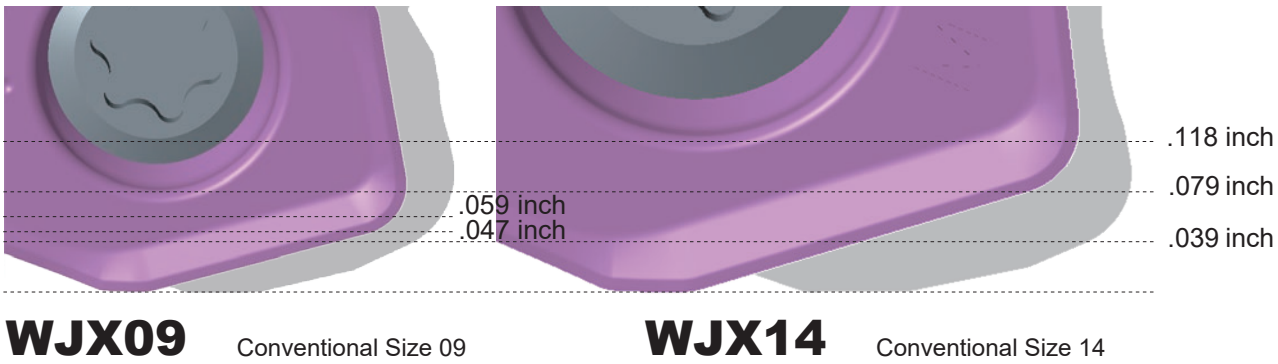
<Helical Milling>
To obtain a flat bottom surface when helical milling, it requires to remove “the uncut part” in the center of the workpiece material at a final pass.
When helical milling, make sure that the depth of cut per helical pass doesn’t exceed the maximum depth of cut (APMX).
<Drilling>
When drilling, set the axial feed per revolution at .008 IPR or less.

OPERATIONAL GUIDANCE

■ Depth of Cut

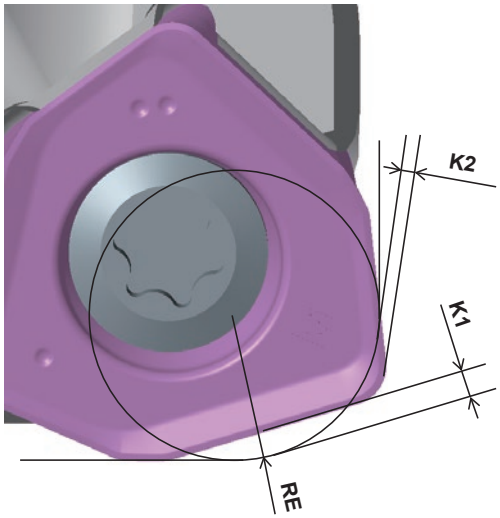
Refer to the following table for the maximum depth of cut of the WJX.
The straight cutting edge extending to the maximum depth of cut (APMX) allows for stable machining even at high depths of cut.
For face milling, lowering the feed rate will allow to exceed the APMX, up to depths of cut shown in the following table (when using the corner R).
For details on the feed rate, refer to the recommended cutting conditions on K315 and K323.

	WJX09	WJX14
High feed and multi-function machining (APMX)	ap=.047 inch	ap=.079 inch
Low feed and Face machining	ap=.059 inch	ap=.118 inch



■ Remaining Stock

For CAM, use CAD data (from online catalogs), or use a definition as a radius milling cutter with reference to the following table.
The approximate radius RE, remaining stock K1, and over cutting amount K2 are as shown in the following table.



WJX09

			MP9140	100 (50–130)	.004 (.002–.006)

Note 1) Actual cutting conditions are estimated to avoid chatter vibration with high rigidity of a machine or workpiece material.
Make appropriate adjustments when chatter and/or insert chipping occurs during cutting.
Use with lowered conditions when there is a big overhang and/or when pocket-cutting.

Note 2) Feed rate for recommended cutting conditions table above based when axial depth of cut is ap=.098" with ARP5, and when depth of cut is ap=.118" with ARP6.
Due to the chip thinning effect when the axial depth of cut fluctuates, feed rate compensation table below shows (correction values "F") to help calculate correct feed.
Example: Feed recommended for ARP5, 304 Stainless steel, MP7130, ap=.039" is .008IPTx1.5(correction values "F")=.012IPT.

Note 3) For slotting, use 70% of the recommended feed rate listed above. For ramping, helical cutting, and plunging, use 50% of the recommended feed rate listed above.

Note 4) Internal coolant is recommended in titanium alloy and heat resistant alloy machining.

Feed rate compensation table, (correction values "F") based on axial depth of cut "ap" fluctuation.

Holder	ap = .020"	ap = .039"	ap = .059"	ap = .079"	ap = .098"	ap = .118"	ap = .138"	ap = .157"	ap = .197"	ap = .236"
ARP5	2.3	1.5	1.2	1.1	1.0	.9	.8	.8	.8	–
ARP6	2.5	1.7	1.3	1.1	1.0	1.0	.9	.9	.8	.8

* Tool body durability may weaken, when the amount of axial cutting exceeds ARP5=.197" and ARP6=.236".

Note 1) When drilling long chips may be generated.
Note 2) When cutting helical holes, do not exceed the largest APMX cutting depth per rotation.
Note 3) Calculate using the following formula for center tool tracks and ϕdc when cutting helical holes: Center tool tracks ϕdc=desired hole diameter ϕDH tool diameter ϕDCX
Note 4) Use of air blow to disperse chips effectively is strongly recommended.
Note 5) Insert pockets are small in fine pitch and small diameter cutters therefore care should be taken to avoid chip jamming. Regulate thefeed and speed accordingly.
Note 6) When machining with a large diameter cutter at high feed rates, chip jamming may occur. Regulate the feed and speed accordingly.

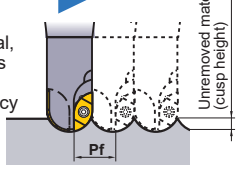
Using the ARX Effectively (Reducing Unremoved Material)

●When Milling Even Surfaces

Ball nose end milling

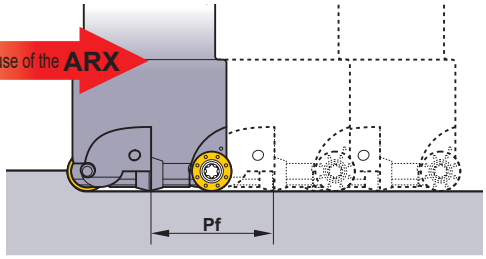
To reduce unremoved material, the pick feed needs to be reduced. (Machining efficiency will decrease.)



With the use of the ARX

Higher machining efficiency

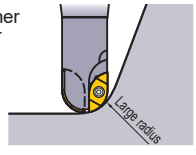
Even with a large pick feed, no unremoved material will remain.



●When Milling Corner Radius

Ball nose end milling

To machine small corner radii, the tool diameter needs to be reduced. (Tool rigidity will decrease.)



With the use of the ARX

A large shank diameter offering high rigidity can also machine small corner radii. (The cutting load of a subsequent finishing tool will be decreased thereby lengthening its' tool life. Surface finish quality will be improved.)

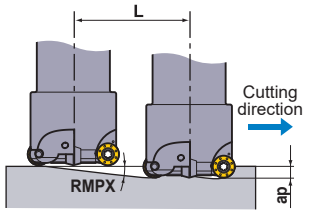
CUTTING MODE MAXIMUM CAPACITIES

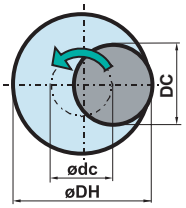
■ Ramping

Finding a cutters' distance moved **"L"** when depth of cut reaches **"ap"** at a ramping angle of **"α°"**.

L=ap/tan α (mm)



■ Helical Milling



●Setting a tool's center excursion

ødc = øDH - DC

Tool's center excursion | Required bore diameter | Tool's cutting diameter

●For the depth of cut per pass, refer to the cutting conditions on page K343 for helical milling.

●Set the machine spindle revolution so that the tool is rotating and cutting in a down cut direction.

FITTING INSERTS ON HOLDERS

1. Clean the insert seat

Clean the insert seat in the holder body by blowing air or using a brush.

2. Fit the insert

Place the concave mark of the insert into the clamp-screw-fastening part of the holder(only SRF type inserts). Fasten the clamp screw while firmly pressing the insert against the insert seat wall. You are recommended to use the special lubricant for preventing screw seizing, MK1KS, and to fasten with recommended torque.

FITTING INSERTS ON HOLDERS

1. Clean the insert seat

Clean the insert seat in the holder body by blowing air or using a brush.

2. Fit the insert

Place the concave mark of the insert into the clamp-screw-fastening part of the holder(only SRF type inserts). Fasten the clamp screw while firmly pressing the insert against the insert seat wall. You are recommended to use the special lubricant for preventing screw seizing, MK1KS, and to fasten with recommended torque.

★ : Stocked in Japan
<2 inserts in one case>

RECOMMENDED CUTTING CONDITIONS FOR SRFT BALL-NOSE INSERTS

	Workpiece Material	Hardness	Insert Grades	Cutting Speed **vc** (SFM)	Feed per Tooth **fz** (IPT)	Depth of Cut **ap** (inch)
P	Mild Steel	180HB	**EP6120**	655 (260—985)	.008 (.004—.012)	≤0.05DC
P	Carbon Steel Alloy Steel	180—280HB	**EP6120**	655 (260—985)	.008 (.004—.012)	≤0.05DC
P			**VP15TF**	655 (260—985)	.008 (.004—.012)	≤0.05DC
P		280—350HB	**EP6120**	655 (260—985)	.008 (.004—.012)	≤0.05DC
P	Pre-hardened Steel	35—45HRC	**EP6120**	490 (260—655)	.008 (.004—.012)	≤0.05DC
P			**VP15TF**	490 (260—655)	.008 (.004—.012)	≤0.05DC
P	Alloy Tool Steel	350HB	**EP6120**	490 (260—655)	.008 (.004—.012)	≤0.05DC

K	Gray Cast Iron	350MPa	**MP8010**	820 (260—1475)	.008 (.004—.012)	≤0.05DC
K	Ductile Cast Iron	450MPa	**MP8010**	655 (260—985)	.008 (.004—.012)	≤0.05DC
K		800MPa	**MP8010**	655 (260—985)	.008 (.004—.012)	≤0.05DC
N	Copper,Copper Alloys		**EP6120**	655 (260—985)	.008 (.004—.012)	≤0.05DC
H	Hardened Steel	45—55HRC	**MP8010**	330 (195—395)	.008 (.004—.012)	≤0.05DC
H		55—65HRC	**MP8010**	260 (195—395)	.008 (.004—.012)	≤0.01DC

Note 1) The values above are for average machining conditions. The optimum values can change slightly according to the condition and rigidity of the machine and work holding. Adjust the values accordingly.
Note 2) For end mills with a carbide shank, up to 20% higher cutting conditions are possible.
Note 3) Please note the following when machining hardened steel with MP8010.
- Please shorten the overhang length as much as possible.
- Use with carbide shank recommended.
- Take special care with the depth of cut to prevent fracture.

RECOMMENDED CUTTING CONDITIONS FOR SUFT CORNER RADIUS INSERT

■Shoulder Milling(When small width of cut.*)

	Workpiece Material	Hardness	Insert Grades	Cutting Speed **vc** (SFM)	Depth of Cut **ap** (inch)	Wide of Cut **ae** (inch)	Feed per Tooth **fz** (IPT)
P	Carbon Steel Alloy Steel	180—280HB	**VP15TF**	655 (260—985)	≤0.05DC	≤0.05DC	.008 (≤.016)

	Hardened Steel	55—65HRC	**MP8010**	260 (195—330)	≤0.05DC	≤0.02DC	.004 (≤.008)

* When the pick feed direction is along the axis of the tool such as finish machining at the wall part.

■Slot Milling / Shoulder Milling(When large width of cut.*)

	Workpiece Material	Hardness	Insert Grades	Cutting Speed **vc** (SFM)	Depth of Cut **ap** (inch)	Wide of Cut **ae** (inch)	Feed per Tooth **fz** (IPT)
P	Carbon Steel Alloy Steel	180—280HB	**VP15TF**	655 (260—985)	≤0.02DC	≤DC	.008 (≤.016)
	Pre-hardened steel	≤45HRC	**VP15TF**	490 (260—655)	≤0.02DC	≤DC	.006 (≤.012)
	Alloy Tool Steel	180—380HB	**VP15TF**	490 (260—655)	≤0.02DC	≤DC	.006 (≤.012)
M	Stainless Steel	≤270HB	**VP15TF**	490 (330—655)	≤0.02DC	≤DC	.008 (≤.016)
K	Cast Iron	Tensile Strength ≤350MPa	**MP8010**	835 (590—1475)	≤0.03DC	≤DC	.012 (≤.016)
	Ductile Cast Iron	Tensile Strength ≤800MPa	**MP8010**	655 (260—985)	≤0.03DC	≤DC	.012 (≤.016)
H	Hardened Steel	45—55HRC	**MP8010**	330 (260—395)	≤0.01DC	≤DC	.004 (≤.006)
	Hardened Steel	55—65HRC	**MP8010**	230 (195—330)	≤0.01DC	≤DC	.004 (≤.008)

* When the pick feed direction is along the radius of the tool such as finish face machining.

Note 1) This cutting condition is the standard condition when using the steel standard shank type.
If vibration or chipping on cutting edge occurs, please decrease the cutting condition as width of cut, depth of cut and feed per tooth depending on the situation.

Note 2) Recommended cutting speeds apply to tool outside diameter.
Please calculate the spindle speed of tool in the following expressions.
Spindle speed of cutting tool $n(min^{-1})=12\times$Cutting speed vc ÷ Diameter of cutting tool DC ÷ 3.14

CALCULATING ACTUAL CUTTING SPEED

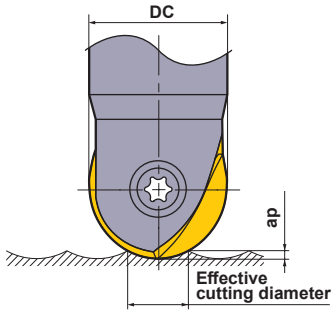
1. Effective cutting diameter = $2\sqrt{ap\,(DC-ap)}$

DC: Tool diameter (inch)
ap : Depth of Cut (inch)

2. Using ap ➡ Calculate cutting speed at the depth of cut line.

$$vc = \frac{2\pi n\sqrt{ap(DC-ap)}}{12}$$

vc : Actual cutting speed (SFM)
n : Revolution (min^{-1})



SELECTING PICK FEED

Theoretical

$$h = \frac{(Pf)^2}{8R}$$

h : Cusp height
Pf : Pick feed
PRFRAD : Ball nose or corner radius

Actual surface roughness Rz will be about 3 times worse than theoretical h.
This is because of the effect of a built-up edge.
To determine Pf, use the formula below based on a particular Rz value.

$$Pf = \sqrt{\frac{8xPRFRADxRz}{3}}$$

Note 1) The **M** type breaker (APMT....PDER-M2) is the first recommendation for its excellent cutting performance.
Please use **H** type breakers (APMT....PDER-H2) due to cutting edge strength.

Note 2) SRM tooling is designed for rough machining applications.
*Programming Note: If you choose to use SRM tooling for semi-finishing applications, care must be taken when setting the tool height. The SRM insert includes a chamfer flat at the tip as illustrated. To assist with SRM programming needs, please download our CAD data from our web site; http://www.mmus-carbide.com

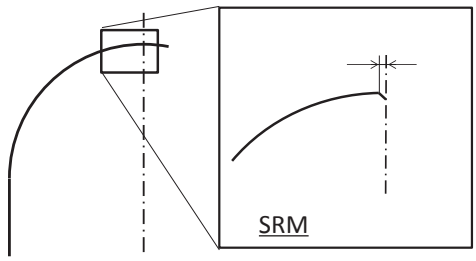
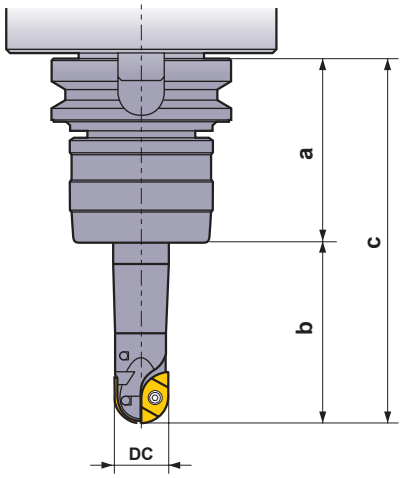
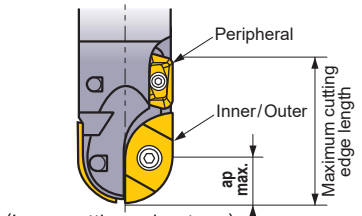
(Low-resistance inner or outer inserts are precision M class type.)
* Selection guide for peripheral cutting edges : The first recommendation is the super sharp M breaker (APMT....PDER-M2).
When cutting edge strength is particularly important, use the H breaker (APMT....PDER-H2).

Note 1) SRM tooling is designed for rough machining applications.
*Programming Note: If you choose to use SRM tooling for semi-finishing applications, care must be taken when setting the tool height. The SRM insert includes a chamfer flat at the tip as illustrated. To assist with SRM programming needs, please download our CAD data from our web site; http://www.mmus-carbide.com



RECOMMENDED CUTTING CONDITIONS





(Long cutting edge type)

Tool Overhang

Recommended cutting conditions on this literature are chosen based on deflection, vibration and machined surface when using a CAT50 arbor. Conditions-**"a"** is the length from a gage line to the arbor end face, and **"b"** is the neck length (tool overhang from the arbor).

(Inch)

Cutting Diameter : DC	Type	a	b	c
.625"	Short	4	1.5	5.5
	Medium		2.5	6.5
	Long		3.5	7.5
.750"	Short		1.5	5.5
	Medium		2.5	6.5
	Long		3.5	7.5
1.000"	Short		2.0	6.0
	Medium		3.0	7.0
	Long		4.0	8.0
1.250"	Short		2.0	6.0
	Medium		3.5	7.5
	Long		5.0	9.0

Recommended Depth of Cut for Long Cutting Edge Type

The maximum cutting edge length of the long cutting edge type with a peripheral insert is 1.4-1.5DC. The peripheral insert is for light machining only.

Please refer the recommended cutting condition or page K373.

					ø25	2	655 (490—720)	—.022	—.039	—.197

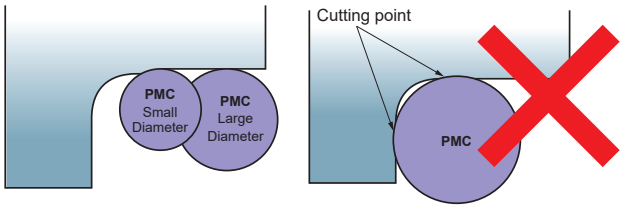
Note 1) The above cutting conditions are general guide lines. Adjustments maybe necessary depending on machine rigidity, workpiece material geometry and clamping.
Note 2) A carbide shank extension is recommended to prevent vibrations.

NOTES ON MACHINING METHODS

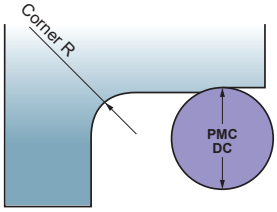
● How to choose an appropriate diameter tool.

Machine plain surfaces with a larger tool and corner radii with smaller diameter cutters.



● Relation of the cutter diameter and corner R size of workpiece material

A guide for the smallest possible workpiece material radius that can be machined is from 0.6—0.7 x diameter of the tool.



Tool diameter DC(mm)	Corner R (inch)
ϕ25	R ≥ .689
ϕ32	R ≥ .866
ϕ40	R ≥ .945

✱Adjust cutting conditions according to the set up.
✱Smaller workpiece material corner radii (only >0.5 x cutter &) may be possible by reducing the width of cut, speed and pick feed.

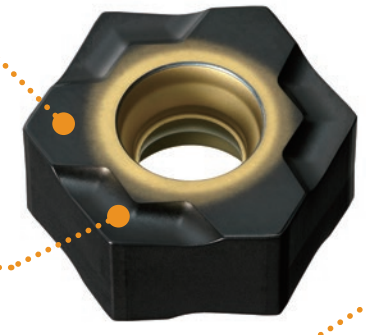
Boring Cutter

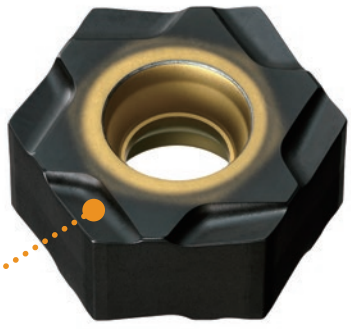
BMR

BMR Engineering Specials

High Clamping Rigidity

High feed processing possible with improved fracture resistance.





Double Positive Breaker

Reduced cutting resistance. Supports open deck work. Effective finished surface due to wiper edge.

12-Corner Type with Right Hand

Economical 12-corner type that preserves comparable insert rigidity of the 6-corner type by securing the seating surface directly below where the cutting force is absorbed.

Highly Rigid 6-corner Type and Economical 12-corner Type Inserts

Body with Peripheral Cutting Edge Run-out Adjustable Mechanism

Economical M-class insert can be used since run out is adjustable.

* BMR Cutters - Non stock, engineering specials produced to order only.

HOW TO INSTALL THE SCREW-IN HEAD

①Thoroughly clean the clamp section of the head and the arbor with an air blower or brush before installation.

②Tighten the head at the recommended torque and ensure that there is no gap between the head and arbor.

Screw Size	Recommended Torque (lbf-ft)	Wrench Size (mm)
M8	17.1	10
M10	33.8	14
M12	59.2	19
M16	66.7	24

- Cutting tools become extremely hot during cutting. Never touch them with bare hands after operation as this may produce risk of injuries or burns.
- Do not handle the cutting tools with bare hands as this may cause injuries.
